EEC Introduction

47 YEARS OF INNOVATION

Marlin Walmer

- Founder of Electron Energy Corporation
- Pioneered the processing and subsequent commercialization of an entirely new class of permanent magnets (SmCo) in 1970.

Hamilton Watch Company

World's 1st electric watch named the "Ventura" ...made famous by Elvis Presley.

EEC History

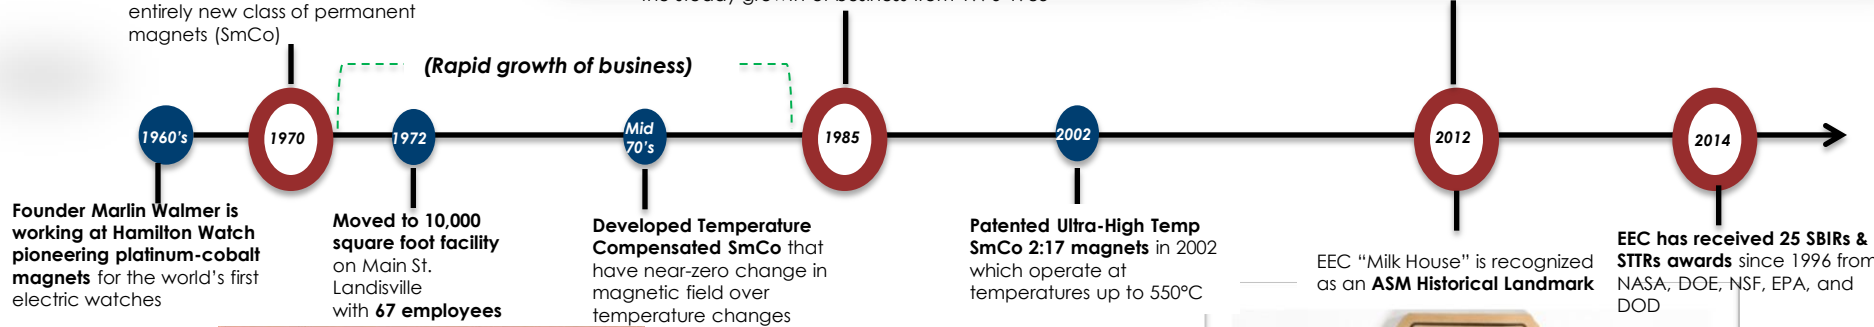

EEC is founded in 1970 (in a Milk House with 2 employees) as Marlin Walmer pioneered the processing and subsequent commercialization of an entirely new class of permanent magnets (SmCo)

40,000 square foot facility was built to support the steady growth of business from 1970-1985

Add a new 45,000 square foot facility now housing the magnet finishing operation

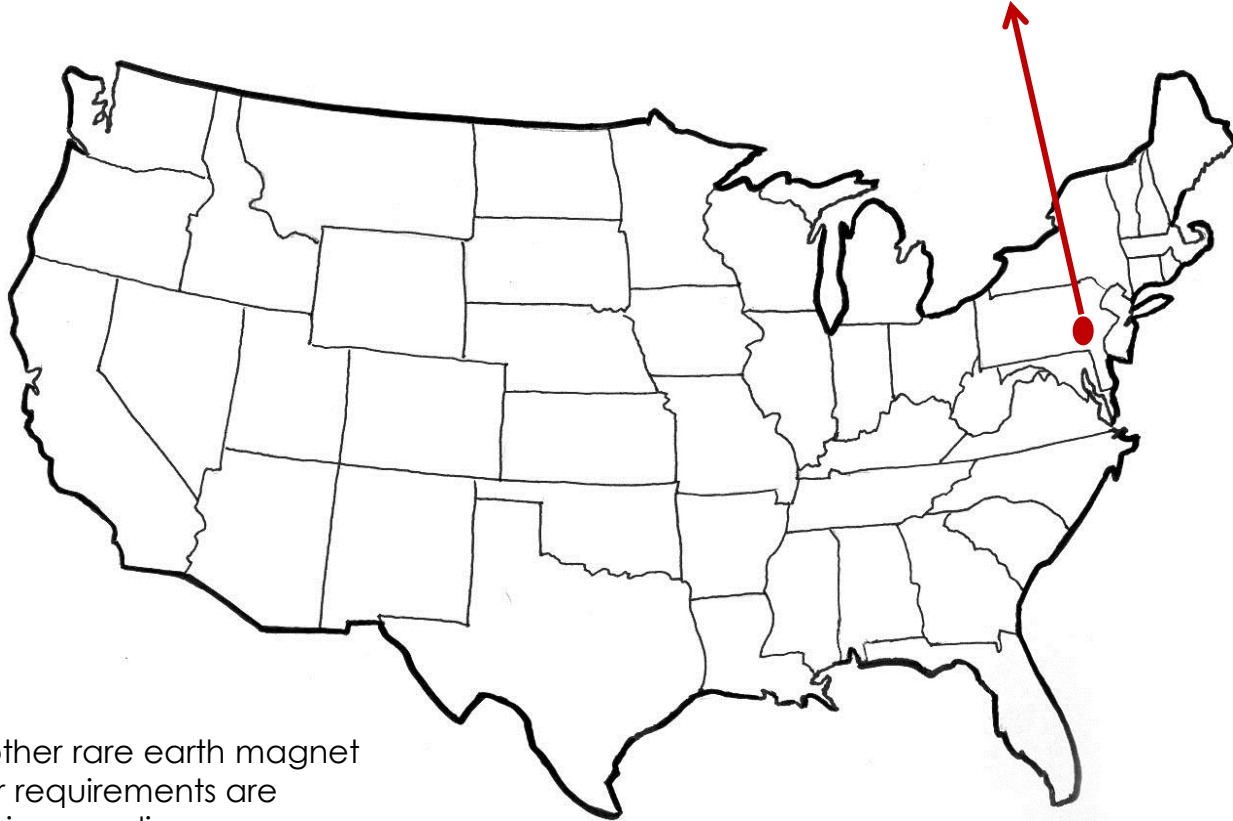

Headquarter

Post-sintering Operations

First and Only Rare Earth Magnet Producer in USA

EEC is the only remaining vertically integrated U.S. SmCo producer remaining in the country.

There are many other rare earth magnet suppliers, but their requirements are supported by foreign suppliers.

EEC Technology Center

Strong and highly skilled engineering support body for efficient realization of customer solutions

- +14 Engineers with a passion for customer magnetic solutions
- Material adaptations for specific needs
 - Production requirements
 - Laboratory scale materials
- FEA Analysis (2D & 3D)
- Application Engineering development and advisory services
- Testing capabilities
- Analysis of magnetic properties
- Over 200 publications
- Diverse engineering team with scientist from China, Romania, India, South Korea, & United States

Brief Overview of Rare Earth Materials

What is Rare Earth Element?

- Elements along or in combinations make up our bodies, our world, our sun, and the entire universe.
- The most abundant element in the Earth's crust is Oxygen (silicon, Al, Fe, Calcium, Sodium, Potassium, Magnesium, Ti, Hydrogen,...)
- **Are the rare earth materials really 'Rare'?** No, but very difficult to mine because it is unusual to find them in concentrations high enough for economical extraction.

- 88 Naturally occurring elements
- 28 created elements
- 17 rare earth elements

iPhone Uses 8 Rare Earth Elements

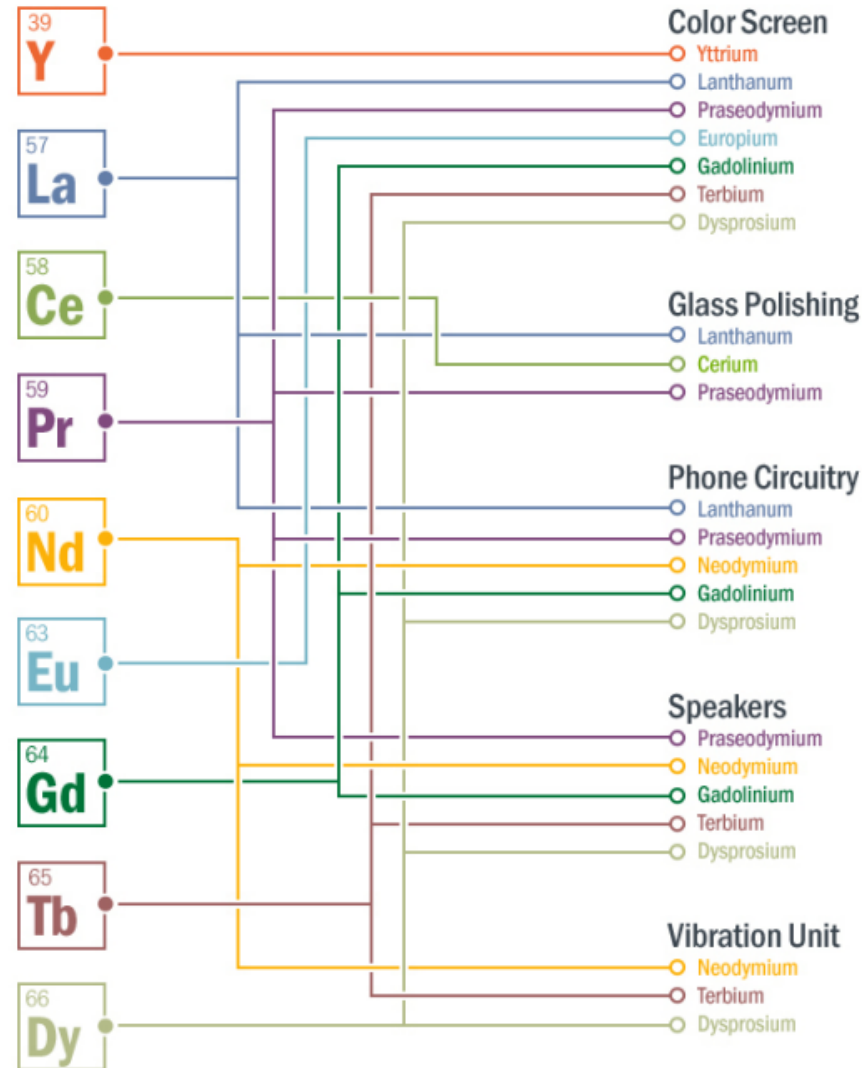

THE PERIODIC TABLE OF IPHONES

Key ingredients in the iPhone include so-called **rare-earth minerals**, elements whose properties make it light, bright and loud.

Yttrium (39 Y)	Praseodymium (59 Pr)	Gadolinium (64 Gd)
Lanthanum (57 La)	Neodymium (60 Nd)	Terbium (65 Tb)
Cerium (58 Ce)	Europium (63 Eu)	Dysprosium (66 Dy)

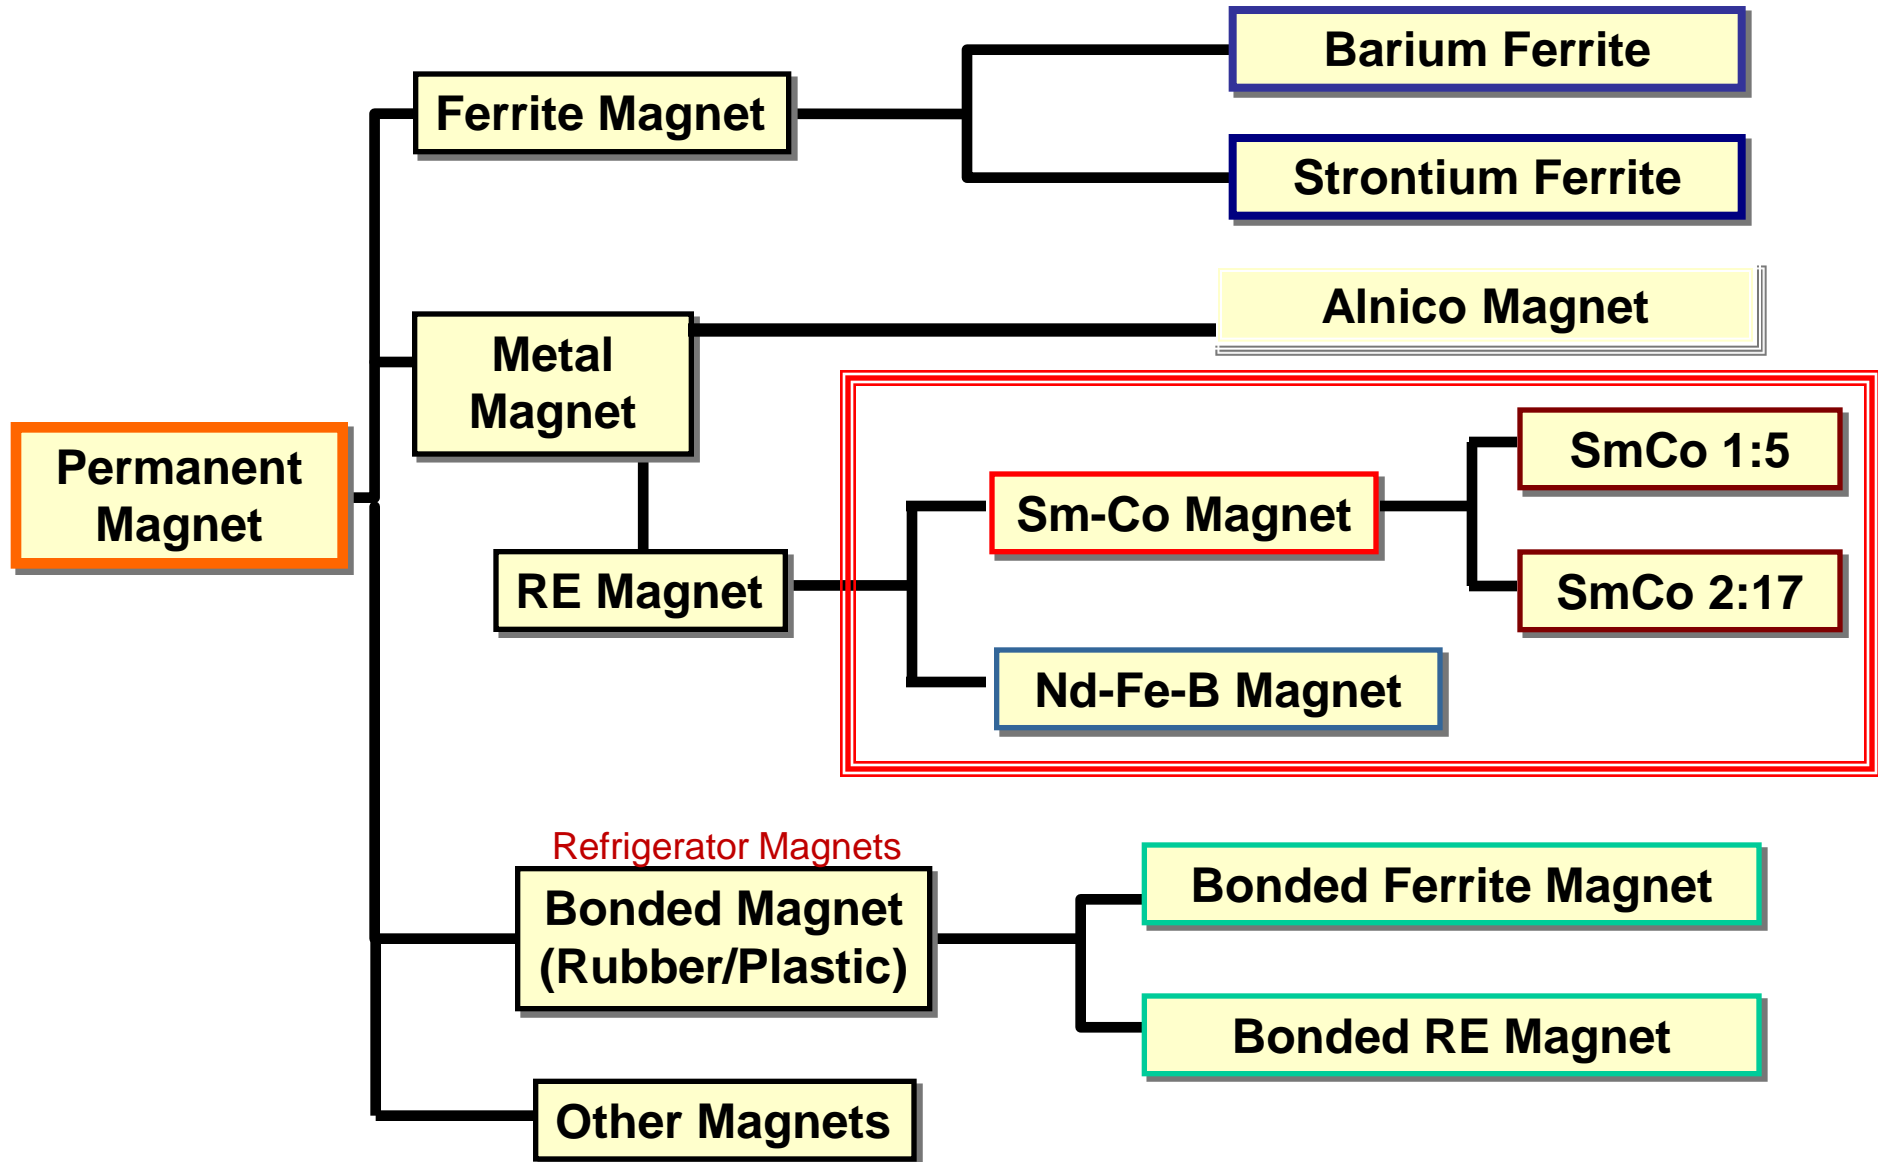

[Source: <http://www.cnet.com/news/digging-for-rare-earths-the-mines-where-iphones-are-born/>]

Minerals such as **Neodymium** are used in magnets that make speakers vibrate to create sound. **Europium** is a phosphor that creates a bright red on an iPhone screen. **Cerium** gets put into a solvent that workers use to polish devices as they move along the assembly line. "Your iPhone doesn't work without rare earths in there," said Mark Smith, chief executive of Molycorp.

Permanent Magnet Types

Sm-Co Magnet Elements

A schematic periodic table grid. The first two columns of the d-block are highlighted with a black border and contain the elements Scandium (Sc) and Yttrium (Y). The rest of the grid is empty.

Sm-Co

How to Make Permanent Magnets

PM Manufacturing Process

Typical Manufacturing Process for Sintered Sm-Co Magnets

Raw Material

EEC purchases pure raw materials-Sm,CO,Fe,Cu,&Zr for the in-house production of SmCo 1:5 & 2:17 alloys

Induction Melting

Pure metals are alloyed in an inert gas using an induction melting furnace. Precise control of alloy chemistry allows EEC to produce a wide range of materials to meet your demanding requirements.

Ball or Jet Milling

We process crushed alloy by milling and reducing to a particle size. Because the resulting fine powder is chemically reactive and pyrophoric in nature, it requires protection from air (oxygen) using inert gas.

Crushed Magnet Powder

Axial, Transverse & Isostatic Pressing

Axial pressing force is parallel to alignment created by magnetic field. Transverse pressing forces is perpendicular to magnetic alignment field. Isostatic pressing provides equal pressure from all directions for pre-aligned powder.

Magnetizing, Testing, & Quality Assurance

Magnetization, stabilization and testing of rare earth magnets are done to satisfy your specific requirements.

Machining

Sintered rare earth magnets, because of their brittle nature, are machined to final dimensions using grinding, slicing, or wire EDM technology.

Before and After
Heating up ~ 1100°C
(just below the melting point)

Sinter

Densification and the development of magnetic properties are accomplished through sinter, solution and aging processes in the presence of a vacuum or an inert gas.

THz Applications

- THz waves are found between microwaves and infrared on the electromagnetic spectrum. This type of radiation was chosen for security devices because it can penetrate matter such as clothing, wood, paper and other porous material that's non-conducting..
- **Security** – Image resolution similar to that viewed with the human eye under visible light. Scanning detect explosives, plastic weapons and drugs from tens of meters away.
- **Health** - T-ray is a lot safer than an X-ray because its radiation is non-ionizing.
- **Communication** – Having a much higher frequency than microwaves, there is huge potential for them to be used to create wireless networks exceeding 100 GBs/s.

(Photo by Northrop Grumman)

The world's first THz-class traveling-wave tube amplifier.

Active Denial System

Non-lethal weapon

ADS projects a focused millimeter wave energy beam which induces intolerable heating sensation on an adversary's skin (0.4mm deep) and cause that individual to be repelled without injury. The invisible '**pain ray**' can travel up to 500m (1,640ft).

Pain without injury

'Active denial systems' deter attackers by sending a non-lethal millimeter-wave of electromagnetic energy, causing a burning sensation.

Wave Penetrates the skin to 1/64 of an inch, causing a feeling similar to being on fire

Gerald R. Ford Aircraft Carrier

EEC Sm-Co magnets are used in nuclear reactor for the Gerald Ford Aircraft Carrier.

[Source: Wikimedia]

On 11/17/2013, Navy launches world's most advanced nuclear aircraft carrier.

STURDY
Critical areas of the vessel including the ammunition and fuel storage areas, have dynamic armor.

ROOMY
The more rearward position of the control tower allows more room on the flight deck for more aircraft.

STEALTHY
The Ford-Class of Aircraft Carrier features improved stealth capabilities which greatly reduces the 333 meter long vessels' radar signature.

Powerful
The ship's two nuclear reactors produce two and a half times more power than the previous Nimitz-class carrier.

Quick
Each of the four propellers measures seven metres in diameter. They allow for a top speed of 30 knots (35 mph)

F-22 Raptor vs. EA-18G Growler

Who wins?

\$150M vs. \$68.2M

1 pilot vs. 2 pilots

EA-18G Growler

Electronic Warfare Aircraft

Maximum speed
1960 km/h (Mach 1.6)

How It Works?

Ferromagnetic Resonance Principle ('Merry-go-round')

[Source: <http://www.novamicrowave.com/understanding-circulator-and-isolaters.php>]

[Source: <https://www.youtube.com/watch?v=Whn3QjHUGlw&spfreload=1>]

Boeing EA 18G Growler Jammer

Radar, Transmitters, Jammers, and other communication devices.

Radar – Allows two directions of communication using the same antenna, reducing the number of parts, saving space and money.

Jammer – protects the sensitive equipment from harmful reflections.

Precision Guidance vs. Faraday's Law

ECC ELECTRON
ENERGY
CORPORATION

Specialists in Rare Earth Magnets and Magnet Systems

Precision Drilling Guidance

How does it work?

- The precision guidance system mounted behind the drill bit consists of **three magnetometers** and **three accelerometers**.
- Both magnetometers and accelerometers give voltage outputs, used to calculate the required directional angles.

Faraday's Law

$$U = vLB$$

[Source: <http://directionaldrilling.blogspot.com>]

Sm-Co vs. Nd-Fe-B

Oil Exploration

Precision Drilling guidance system measures the position, orientation and distance travelled of the drill-head. It helps the operator to determine the trajectory of the drill-head.

Why is the Precision Guidance important?
Significantly reduce the oil extraction cost.

The well pad has ~5% the disturbance area vs. the comparable vertical well scenario

Directional Drilling Animation

Saving 33 Chilean Miners

The precision guidance enables the rescue team to accurately target the starting point of the drill hole, then carefully control the orientation and direction of the drill hole to hit the target with the help of EEC magnets.

Chilean Miners Rescue Plan

Chilean rescuers spent 40 days drilling a borehole in an effort to save the Chilean miners trapped under the earth at the depth of 700 meters since August 5

www.theguardian.com

San Jose Mine

Phoenix rescue capsule

Three capsules have been designed specially for the operation

The shaft has special belts to monitor the blood pressure, temperature, pulse and breathing rate

Oxygen system

Communication system

Safety belts

First borehole (which provides ventilation of the shaft and supplies to the miners)

"Room" where miners stay (50 square meters)

Stages of rescue operation

- 1 Drilling a borehole with a pneumatic hammer that throws the earth to the surface
- 2 Increasing the diameter size of the borehole to 66 centimeters (26 inches) with the use of a bar with a cutter
- 3 Descent of two volunteers (mine specialist and military doctor) to test the capsule
- 4 Pulling up the miners one by one to the surface in the rescue capsule

After reaching the surface:

- miners will be given dark glasses to protect their eyes from bright sunlight
- miners will undergo a medical examination
- miners will be delivered to a field hospital installed near the mine
- once the condition of the rescued miners stabilize, they will be transferred to a medical center in Copiapo in the Atacama Region

NASA Mars Rover Curiosity

The \$2.5 billion robotic explorer,
landed on the Red Planet
Aug. 6, 2012.

Length: 10 feet (3 meters)
Width: 9 feet (2.7 meters)
Height: 7 feet (2.2 meters)
Mass: 1,982 pounds (899 kilograms)

EEC Magnets are used in
gyro systems for Curiosity Rover
on Mars.

NASA Mars mission

The Curiosity rover is designed to travel Mars studying climate and geology. The rover is looking for signs of carbon, the building blocks of life. Some of the rover's features:

Robotic arm

Used to examine and manipulate soil and rocks; it also has two scientific instruments, one uses X-rays to determine materials' composition and the other is a magnifying camera

Laser

Burns small holes in rocks and soil up to 23 feet away and identifies chemical elements

Color cameras

Stereo mastcams on either side of the rover's mast take color pictures and movies in 3-D

UHF antenna

Primary transmission antenna

Plutonium power source

A nuclear battery that converts heat into electricity

Neutron detector

Detects water in rocks and soil

High Temperature Magnet

In the 90's EEC with DoD funding developed a series of SmCo 2:17 magnets with operating temperatures up to **550 °C** (US Patent # 6,451,132)

High Temperature Motor

Concept Design → FEA Validation → Prototype Development

- 3 Phase 6 Pole 5.1 kW (6.8 hp) BLDC Motor with maximum operating temperature of 538°C at 20,000rpm
- The flux density in the air-gap of 0.1cm at 538°C = 0.45Tesla.
- Mechanical retention is preferred because adhesives will not survive at high temperature

High Temperature Magnetic Bearing

Concept Design → FEA Validation → Prototype Development

- Max. Force Output: Force at 13.3 amps with centered rotor was 2800 N (629 lbs), which is 86% of RT result.
- Max. Position-related force: 2220 N at 0.38 mm rotor offset. Yields approximate nps = 5.8 kN/mm, which is about 44% of RT result.
- Test temperatures: PM's were 493°C, Shaft was 350°C, Ceramic Layer on Poles was 366°C.
- SmCo magnets and control coils are working at elevated temperatures.

Magnet Design Theory

$$\frac{q_1}{r^2} \quad \oint E \cdot dA = \frac{Q_{inside}}{\epsilon_0}$$

$$= q(E + v + B) \quad \oint B \cdot dA = 0$$

$$V(r_2) - V(r_1) = - \int_{r_1}^{r_2} E(r) dr$$

$$= - \frac{Q}{\epsilon A} (r_2 - r_1)$$

$$\oint E \cdot dl = - \int \frac{\partial B}{\partial t} \cdot dA$$

$$\partial_\alpha F^{\alpha\beta} = \mu_0 J^\beta$$

$$F_{(\alpha\beta, \gamma)} = 0$$

$$E = \frac{Q}{4\pi\epsilon r^3} r$$

$$V = IR$$

$$V(p_2) = - \int_C E \cdot dl$$

$$\nabla \times E = - \frac{\partial B}{\partial t}$$

$$\nabla \times B = \mu_0 (J + \epsilon_0 \frac{\partial E}{\partial t})$$

Electro magnetism

$$B = \int \frac{\mu_0 I dl \times r}{4\pi r^2}$$

$$F_{21} = \frac{q_1 q_2}{4\pi\epsilon r^2} r_{21}$$

$$E = \frac{Q}{2\epsilon A} r$$

$$V(p_2) - V(p_1) = - \int_{p_1}^{p_2} E \cdot dl$$

$$F = Qv \times B \quad C = \frac{Q}{V} = \frac{4\pi\epsilon}{\frac{1}{r_1} - \frac{1}{r_2}} \quad J^\beta = \begin{pmatrix} cp \\ J_x \\ J_y \\ J_z \end{pmatrix}$$

$$F = q[E + (v \times B)]$$

$$\oint B \cdot dl = \mu_0 I_{enc} \quad F = Eq$$

$$emf = -BA \frac{d\cos(\theta)}{dt}$$

$$emf = -N \frac{d(B \cdot A)}{dt} \quad emf = - \frac{d(BA)}{dt} \quad \oint H \cdot dl = I_{enc}$$

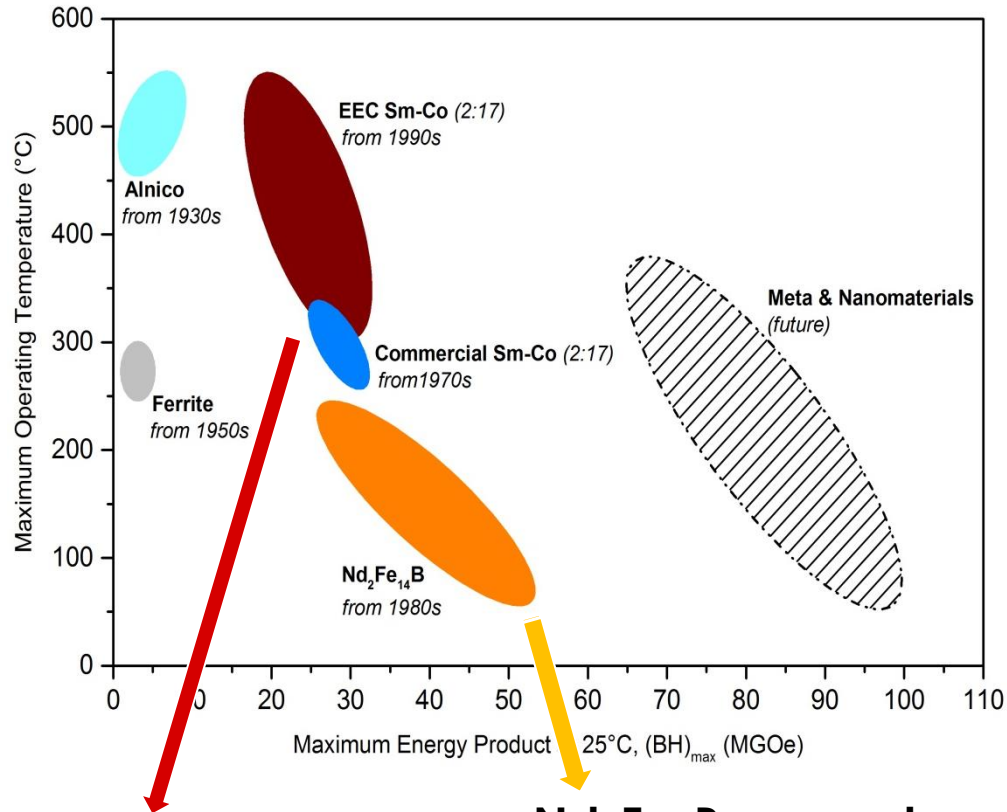

$$\oint H \cdot dl = I_{enc}$$

$$B = \mu_0 \mu_r H$$

$$I_{enc} = \oint H \cdot dl = H \oint dl = HL \quad emf = \frac{d\Phi}{dt}$$

$$\oint B \cdot dl = \mu_0 I + \mu_0 \epsilon_0 \int \frac{\partial E}{\partial t} \cdot dA$$

Magnets vs. Temperature

SmCo magnets

- Highest $(BH)_{max}$ available - up to 33 MGOe
- **Corrosion resistance is excellent;** no surface coating required
- Maximum operating temperature: 300°C
- Superior thermal stability

Nd-Fe-B magnets

- Highest $(BH)_{max}$ available up to 52 MGOe
- Corrosion resistance is low; **surface coating is needed.**
- Maximum operating temperature, ~180°C for most grades, is relatively low compared to SmCo magnets (>300°C).

FAQ

Does a rare earth magnet lose its strength?

Permanent magnet could lose strength if:

- ✓ the working temperature exceeds the specified maximum operating temperature; (thermal demagnetization)
- ✓ the magnets are demagnetized by external magnetic field; (electrical / magnetic demagnetization)
- ✓ the magnets are heavily corroded or oxidized.

FAQ

What are the coating options?

Sm-Co Magnets

No coating is required.

Nd-Fe-B Magnets

Ni plating: very popular for sintered neo. In order to have better protection, **Ni-Cu-Ni plating** is commonly applied.

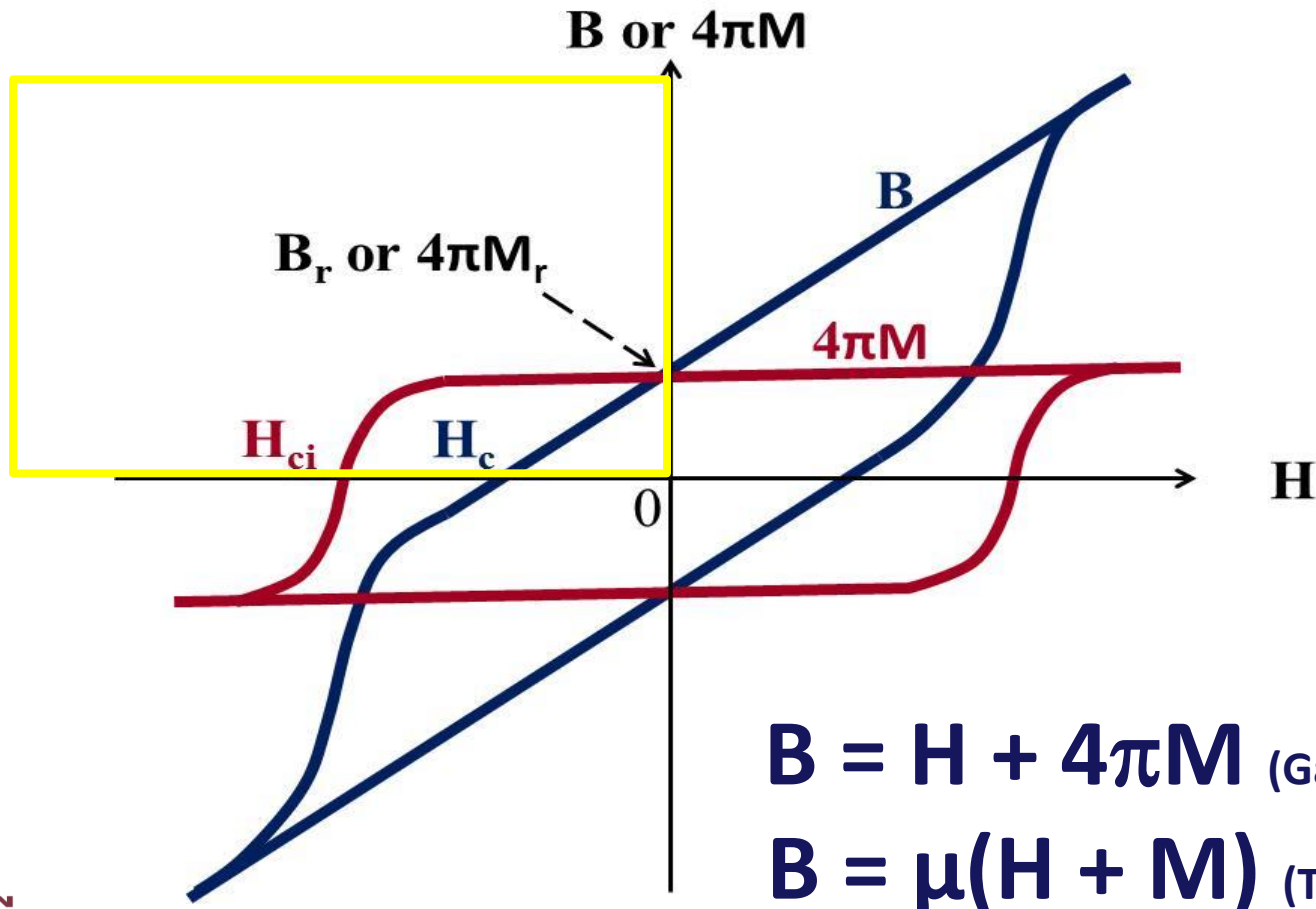

Aluminum IVD: for applications with tight tolerance

Epoxy coating: Very common for bonded neo magnets.

Best choice for outdoor applications or very humid environment.

FAQ

What is the difference between Intrinsic and Normal hysteresis loop?

How Eddy Current Brake Works?

✓ What is the Eddy Current?

An eddy current is a swirling current set up in a conductor in response to a changing magnetic field.

✓ How do they work?

When a conductive object is moving thru the magnetic field, the eddy current is induced on the surface of the conductive material. By **Lenz's law**, the magnetic interaction between the applied field and the eddy currents acts to slow the wheels down in such a way as to create a magnetic field opposing the change. This force is called '**Lorentz Force**'. The faster the wheels are spinning, the stronger the braking effect.

$$\mathcal{E} = -\frac{d\Phi_B}{dt}, \text{ Lenz's law}$$

$$\mathbf{F}_{mag} = q(\mathbf{v} \times \mathbf{B}) \text{ Lorentz Force}$$

\mathbf{F} is the force

q is the electric charge of the particle

\mathbf{v} is the velocity of the particle

\mathbf{B} is the magnetic field
