- PHMSA Special Permits
- Working Paper 48
- Lithium Battery Cargo Incidents
Mission:
Office of Hazardous Materials Safety (AXH) ensures and promotes the safe transportation of Hazardous Materials (or HAZMAT) in air commerce.

Vision:
To be recognized as the global leader for security and aviation safety by providing superior products and services through a creative environment where motivation, recognition, and collaboration come together to inspire successful innovation.
Office of Hazardous Materials Safety (AXH)

Ensures and promotes the safe transportation of Hazardous Materials (or HAZMAT) in air commerce through:

- Regulatory oversight of HAZMAT carried by the flying public or transported on aircraft.
- Risk-based decision making principles and a Safety Management System (SMS) approach to identify and address prioritized risks.
- The coordination of national and international stakeholder engagement and safety promotion.
AXH Continued...

- AXH Subject Matter Experts represent the FAA on HAZMAT-related international panels and Committees and Multi-Disciplinary Groups to develop standards, regulations, and mitigation strategies for global safe transportation.

- Research, coordination, and oversight of rulemaking efforts and the Special Permits and Approvals through the Department of Transportation’s Pipeline and Hazardous Materials Safety Administration (PHSMA).
Current Regulatory Focus

Conditions encountered outside of normal transportation present a risk that is typically not considered. The current regulatory focus includes:

- Properly classifying the material;
- Selecting the appropriate packaging;
- Communicating the hazard;
- Limiting the quantity of the hazardous material being transported;
- Mode of transportation; and
- Segregation requirements.
# Packing Instruction 965, Section 1A

Special Permits Explained

Special permits are documents issued to ensure the safe transportation of hazardous materials (hazmat) when not otherwise permitted in the Hazardous Materials Regulations.

- DOT-issued variances from HMR regulations;
- Achieve a level of safety at least equal to the safety level required under Federal hazmat law;
- Or are consistent with the public interest if a required safety level does not exist;
Special Permits Cont...

- Provide safe alternatives to the HMR;
- Another entity can apply for party status to any existing special permit;
- A hazmat employee MUST RECEIVE TRAINING on the requirements and conditions of the special permit;
- Special Permits expire.
Applying for Special Permits

- Must be written in English and submitted at least 120 days before the requested effective date.

- Applications can be submitted by fax to (202) 366-3753 or (202) 366-3308 or email at specialpermits@dot.gov

- Or submitted using PHMSA's online system at: http://www.phmsa.dot.gov/hazmat/regs/sp-a

- Requirements are found in 49 CFR 107.105.
Special Permit Fitness Process

Inspections are geared toward safety and overall compliance.

Document proposes to add the new UN entry UN 3536, “Lithium batteries installed in a cargo transport unit” to Table 3-1 in Part 3 of the Technical Instructions.

- Applicable to containerized energy storage systems.
- Based on need in disaster areas and remote islands / mining sites.
- Special provision “A2XX” is proposed to be assigned to this entry.
- No quantity limitation due to size potential.

... This entry only applies to lithium ion batteries (including lithium polymer batteries) or lithium metal batteries installed in a cargo transport unit and designed only to provide power external to the cargo transport unit. The lithium batteries must meet the requirements of 2.9.3.1 a) to e).

Lithium Battery Safety Concerns

- Lithium batteries provide a clear example of a hazardous material whose risks to aviation safety are both high and evolving.

- For example, regulations specify the size of the package and do not evaluate the effect of unlimited packages or one package in relation to the capabilities of aircraft and operator equipment.
As Of May 22, 2017, 160 Air/Airport Incidents Involving Lithium Batteries

LITHIUM BATTERIES & LITHIUM BATTERY-POWERED DEVICES

Aviation Cargo and Passenger Baggage Events Involving Smoke, Fire, Extreme Heat or Explosion Involving Lithium Batteries or Unknown Battery Types

In an effort to more closely focus on lithium battery events, this list has been revised to include events involving lithium or unknown battery types.

As of May 22, 2017, 160 air/airport incidents involving lithium batteries carried as cargo or baggage that have been recorded since March 20, 1991

Note: These are recent cargo and baggage incidents that the FAA is aware of. This should not be considered as a complete listing of all such incidents. The incident summaries included here are intended to be brief and objective. They do not represent all information the FAA has collected, nor do they include all investigative or enforcement actions taken. This list does not include three major aircraft accidents where lithium battery cargo shipments were implicated but not proven to be the source of the fire: An Asiana Airlines 747 near South Korea on July 28, 2011, a UPS 747 in Dubai, UAE on September 3, 2010 and a UPS DC-8 in Philadelphia, PA on February 7, 2006

The National Transportation Safety Board determined that the probable cause of this accident was an *in-flight cargo fire*, which was most likely located within *cargo container 12, 13, or 14.*
The UAE GCAA’s report states that the fire began in the section of the cargo that included “a significant number of lithium type batteries and other combustible materials” and added that “the fire escalated rapidly into a catastrophic uncontained fire.”

The flight to Shanghai was loaded with 58 tons (57 long tons; 64 short tons) of cargo; 90% of the freight was standard cargo, semi-conductors, mobile phones, liquid crystal displays, and light-emitting diodes. The remainder included 400 kg (880 lbs.) of lithium batteries, paint, resin solutions and other liquids.
