Why Lithium-XXX Battery?

Periodic Table of the Elements

The image shows a standard periodic table of elements. An orange arrow points to the element Lithium (Li) in the first column, second row. The table includes element symbols, names, atomic numbers, and atomic weights. The lanthanide and actinide series are shown at the bottom.

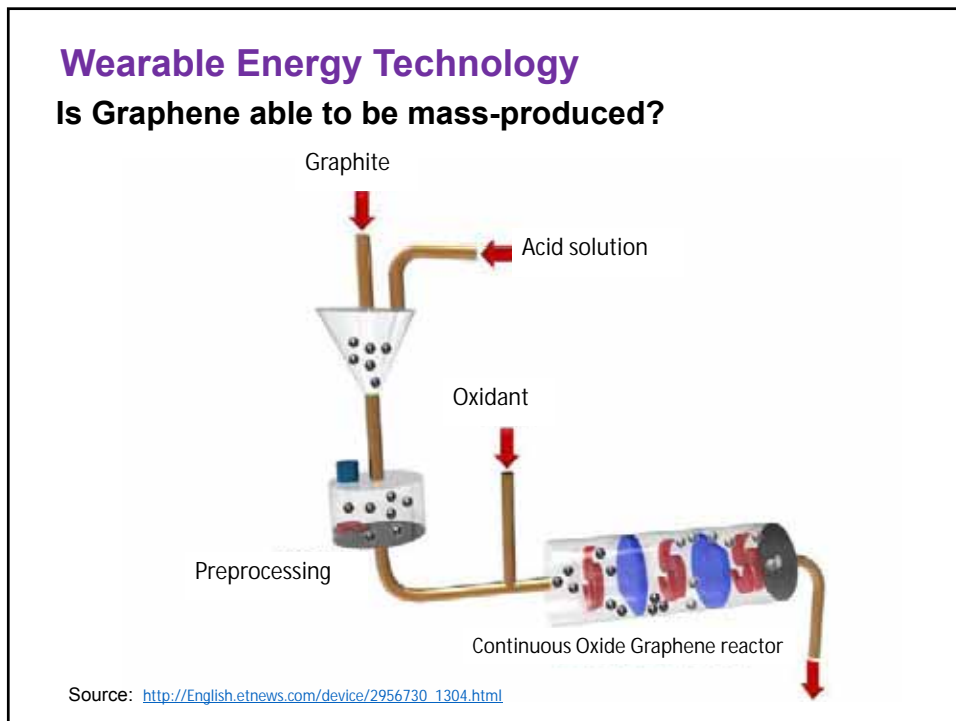

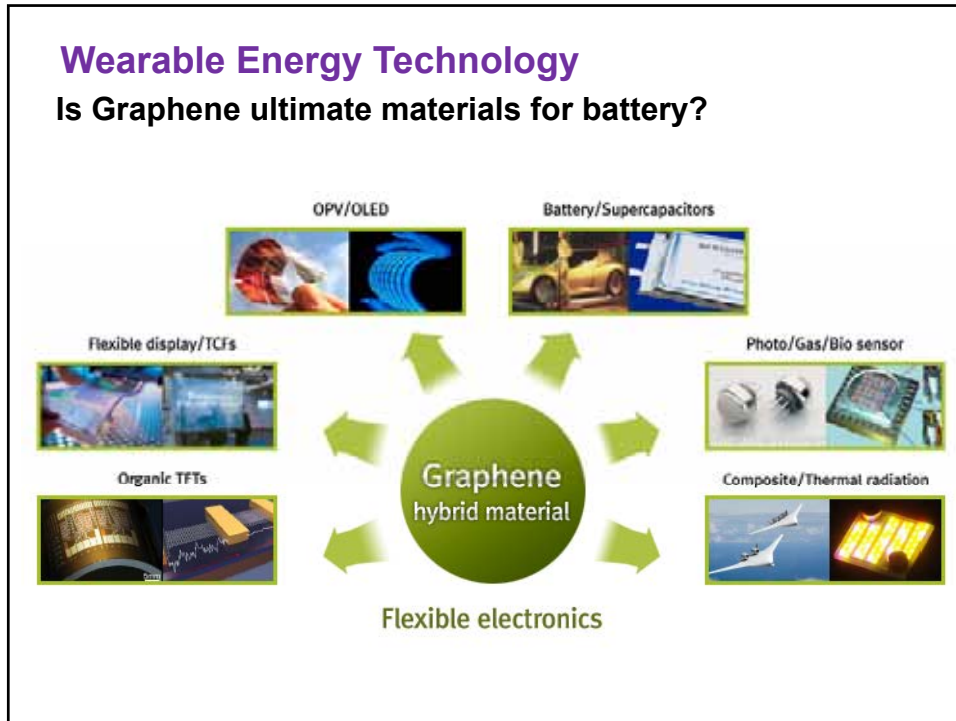

- Highly electropositive(so higher voltage is obtained depending upon the cathode used)
- High electrochemical equivalence
- High capacity (3.82Ah/g) and energy density (1470Wh/Kg)
- Good conducting agent (Good at transport electron)
- Good mechanical stability (low density of lithium metal (0.534g/cc))
- Ease of fabrication/compact design

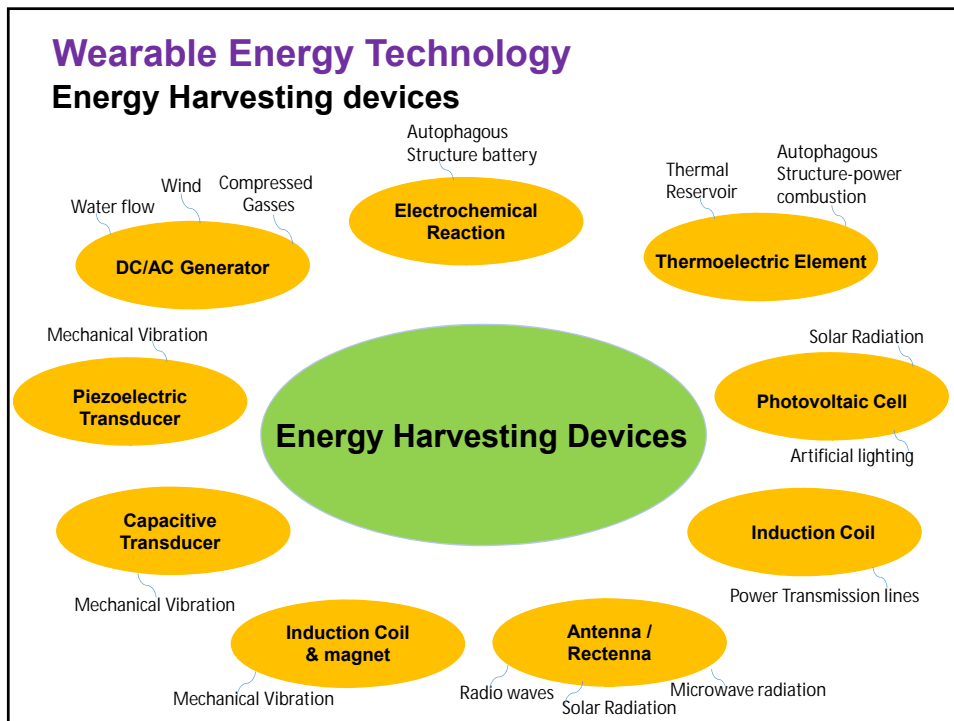

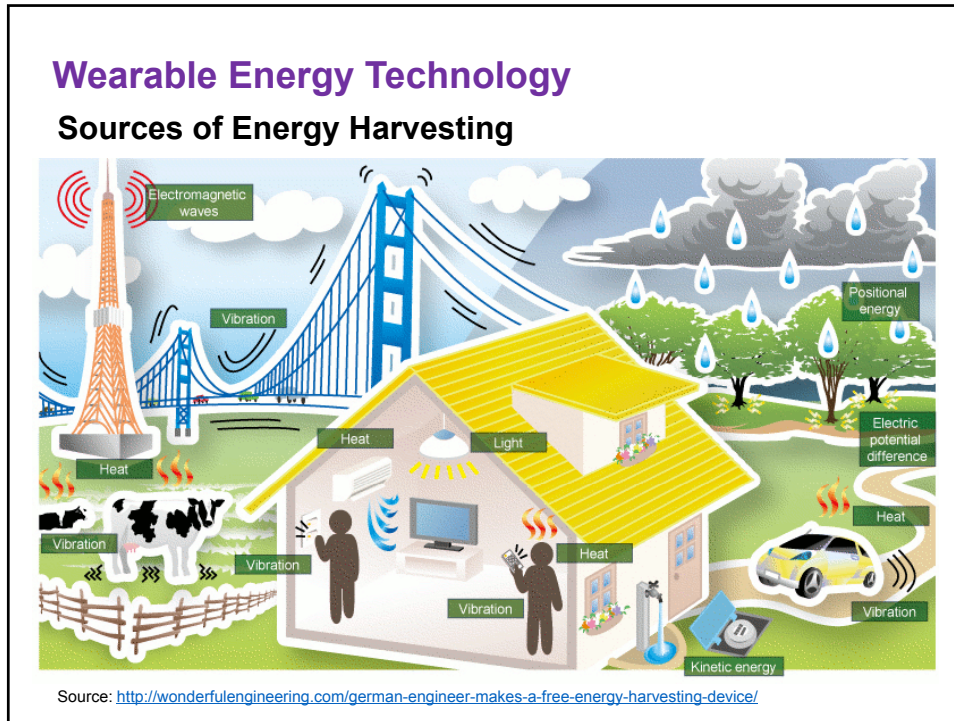

Wearable Energy Technology

Why thin and long lasting battery is difficult to make?

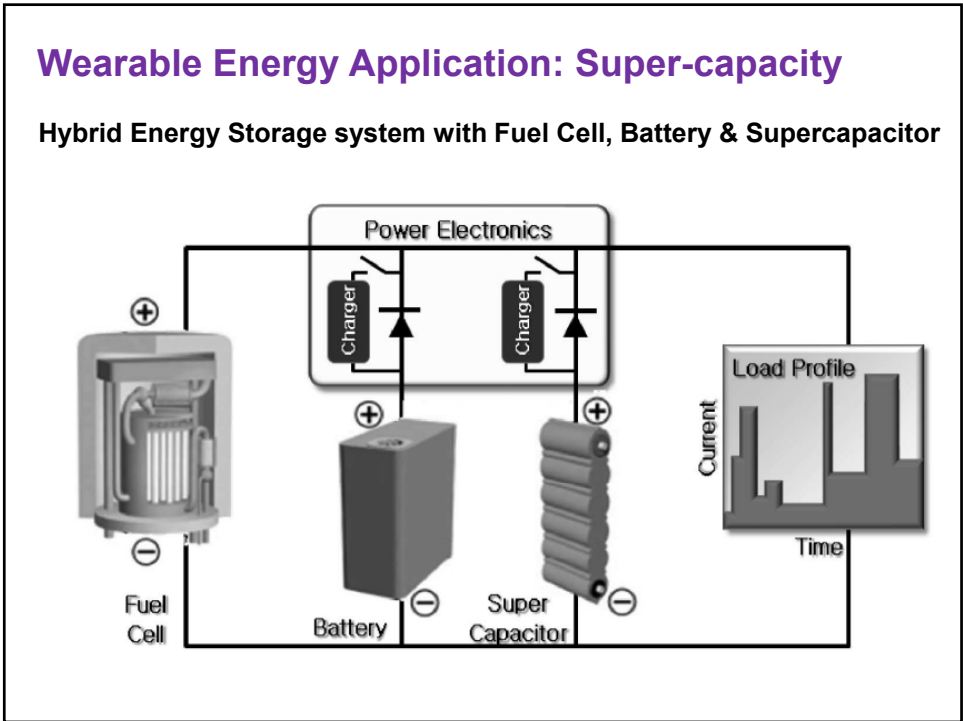

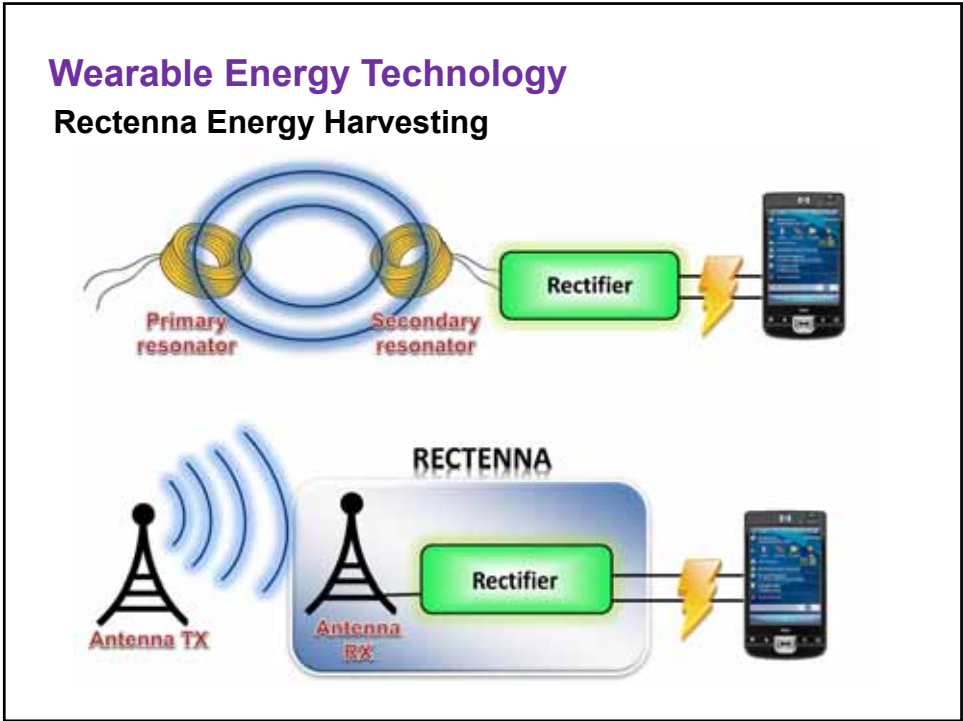

Wearable Energy Technology Kinetic Energy Harvesting

The diagram illustrates kinetic energy harvesting. It shows three input sources: a photograph of people walking on a paved area, a 'Push Button' being pressed, and 'Vibration' represented by a sine wave. These inputs are shown entering a piezoelectric material, which then produces 'Electricity output' as indicated by a lightning bolt symbol. To the right, a blue and green sneaker is shown with a piezoelectric component embedded in the sole. Below the main diagram are two photographs: one of a car driving over a road with piezoelectric tiles, and another of a person walking through a glass revolving door.

Wearable Energy Technology Thermal Energy Harvesting

The diagram illustrates thermal energy harvesting. It shows a small piezoelectric device with dimensions 2.4 mm, 1.1 mm, and 3.3 mm. A temperature gradient is shown with a blue arrow labeled 'cold' pointing up and a red arrow labeled 'hot' pointing down. A green arrow labeled 'Electrical Power' points to the right from the device. To the right, a white cube-shaped device with a circular port and wireless signal icons is shown. Below the main diagram are three photographs of different thermal harvesting components: a cylindrical device on a green PCB, a blue PCB with a heat sink, and another blue PCB with a larger heat sink.

Conclusion

Both S/W and H/W need to be optimized to support longer battery life span

Conclusion

Scientists need to focus more on their research not on some PR stuff

Conclusion

New break through technology is urgently required.
