

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Biologically Plausible Artificial Neural Networks

João Luís Garcia Rosa

Pontifical Catholic University of Campinas
PUC-Campinas – São Paulo – Brazil
July 31st, 2005

"The lecture material in this book is intended for strictly limited distribution to IJCNN2005 tutorial attendees only. This work is copyrighted by the tutorial speaker. No duplication of this work is permitted without the written consent of the author."

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Purpose of this Tutorial

- An attempt to restore biological inspiration of current connectionist systems;
- Two parts:
 - Part 1: History, artificial models, the brain, and Hebbian learning,
 - Part 2: Learning algorithms, connectionist representations, neuron signalling, and a model proposal.

Rosa, J. L. G. 2

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Part 1 Outline

- Artificial Neural Networks - History
- Simplified mathematical models for the neuron
- Human brain
- Hebbian learning

Rosa, J. L. G. 3

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Part 2 Outline

- Back-propagation
- Generalized recirculation
- Connectionist representations
- Intraneuron and interneuron signaling
- A biologically plausible ANN model proposal
- Conclusions

Rosa, J. L. G. 4

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Part 1

- **Artificial Neural Networks - History**
- Simplified mathematical models for the neuron
- Human brain
- Hebbian learning

Rosa, J. L. G. 5

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Artificial Neural Networks

- Based on an abstract and simplified view of the neuron;
- Artificial neurons connected and arranged in layers to form large networks;
- Learning and connections determine the network function;
- Connections can be formed through learning and do not need to be 'programmed'.

Rosa, J. L. G. 6

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Artificial Neural Networks

- Recent ANN models:
 - lack many physiological properties of the neuron;
 - more oriented to computational performance than to biological credibility;
- Purpose of this Tutorial:
 - an attempt to restore biological inspiration of current connectionist systems.

Rosa, J. L. G. 7

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Artificial Neural Networks

- A biologically inspired connectionist approach should present:
 - neurophysiologically motivated training algorithm;
 - bi-directional connectionist architecture;
 - several other features, e. g., distributed representations.

Rosa, J. L. G. 8

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

History

- 1943: McCulloch and Pitts: first mathematical neuron model;
- 1948: Wiener's *Cybernetics* book;
- 1949: Von Neumann's speech at University of Illinois: McCulloch and Pitts theory propagation;
- 1949: Donald Hebb: *The Organization of Behavior*: learning rule for synaptic modification.

Rosa, J. L. G. 9

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

History

- 1951: Minsky and Edmonds: first ANN computer:
 - *SNARC - Stochastic Neural-Analog Reinforcement Computer*;
- 1957: Rosenblatt: perceptron;
- 1960: Widrow and Hoff: adaline;
- 1969: Minsky and Papert: *Perceptrons*:
 - book with negative result on representation capability of 1-layer ANNs.

Rosa, J. L. G. 10

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

History

- 1969: Bryson and Ho: discovery of Back-propagation learning algorithm;
- 1980: Grossberg: self-organization;
- 1982: Hopfield: recurrent networks with symmetrical synaptic connections;
- 1982: Kohonen: self-organizing maps;
- 1985: Ackley, Hinton, and Sejnowski: *Boltzmann Machine*: first succeeded multi-layer ANN.

Rosa, J. L. G. 11

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

History

- 1986: McClelland and Rumelhart: *Parallel Distributed Processing: Explorations in the Microstructures of Cognition* (2 volumes):
 - Back-propagation reinvented;
- 1988: Broomhead and Lowe: radial basis functions (RBF): option to multi-layer perceptrons.

Rosa, J. L. G. 12

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

History

– Fu (1991 and 1993), Towell and Shavlik (1993), Setiono and Liu (1996), Omlin and Giles (1996), d'Avila Garcez *et al.* (2001): symbolic knowledge extraction from ANNs
→ symbolic-connectionist approach → knowledge-based ANNs.

Rosa, J. L. G. 13

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Part 1

- Artificial Neural Networks - History
- **Simplified mathematical models for the neuron**
- Human brain
- Hebbian learning

Rosa, J. L. G. 14

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

McCulloch-Pitts neuron (1943)

- First mathematical model:
 1. neuron activity \rightarrow “all-or-none” process;
 2. a certain fixed number of synapses \rightarrow excited within a latent addition period \rightarrow to excite a neuron: independent of previous activity and of neuron position.

Rosa, J. L. G. 17

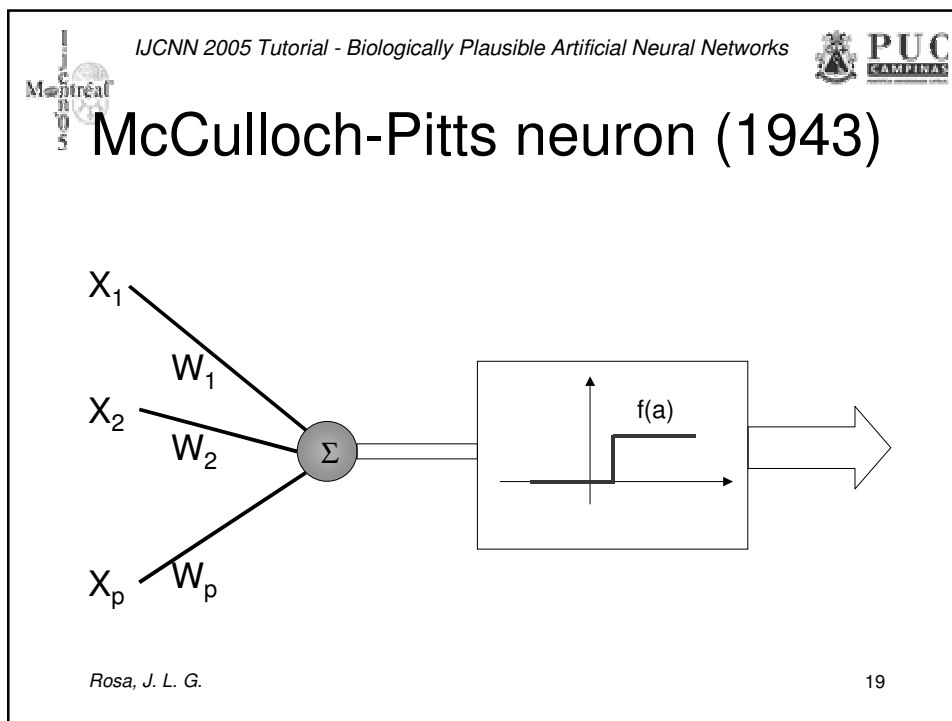

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

McCulloch-Pitts neuron (1943)

3. only significant delay in nervous system: synaptic delay;
4. activity of any inhibitory synapse prevents neuron from firing;
5. network structure does not change along time.

Rosa, J. L. G. 18

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

McGill University Montreal 1955

PUC CAMPINAS

Simplified mathematical model for the neuron

- x_i : inputs (binary);
- w_i : synaptic weights (real, because the synapses can inhibit (-) or excite (+) and have different intensities);
- computation occurs in soma:

$$\sum_{i=0}^n x_i \cdot w_i$$

$x_0 = 1$ and $w_0 = \beta = -\theta$
 $\beta = \text{bias}$ and $\theta = \text{activation threshold}$.

Rosa, J. L. G.

20

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

ICANN 2005

PUC CAMPINAS

Simplified mathematical model for the neuron

- The activation function can be:
 - hard limiter,
 - threshold logic,
 - sigmoid.
- the biologically more plausible \rightarrow sigmoid function.

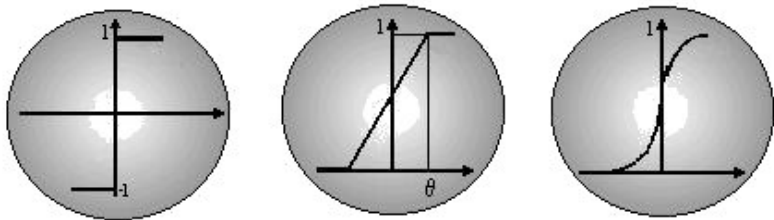

Rosa, J. L. G. 21

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

ICANN 2005

PUC CAMPINAS

Activation functions

The figure shows three circular frames, each containing a graph of an activation function. The first frame, labeled 'Hard Limiter', shows a step function that jumps from -1 to 1 at the origin. The second frame, labeled 'Threshold Logic', shows a function that is zero for negative inputs and increases linearly for positive inputs, crossing the value 1 at a threshold θ . The third frame, labeled 'Sigmoid', shows a smooth S-shaped curve that transitions from 0 to 1.

Hard Limiter Threshold Logic Sigmoid

Rosa, J. L. G. 22

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

The perceptron

- Rosenblatt's perceptron (1957):
 - takes a weighted sum of neuron inputs,
 - sends output 1 (*spike*) if this sum > activation threshold.

Rosa, J. L. G. 23

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

The perceptron

- A linear discriminator:
 - given 2 points, a straight line is able to discriminate them;
 - for some configurations of m points, a straight line is able to separate them in two classes.

Rosa, J. L. G. 24

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

26

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Exclusive-OR

- $\{(0,0), 0; (0,1), 1; (1,0), 1; (1,1), 0\}$

- and by n straight lines?

Rosa, J. L. G. 27

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Perceptron limitations

- One-layer feed-forward network (non-recurrent);
- Only capable of learning solution of linearly separable problems;
- Its learning algorithm (delta rule) does not work with networks of more than one layer.

Rosa, J. L. G. 28

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Learning algorithm LMS

- Learning algorithm used by one-layer perceptrons:
 - LMS = Least-Mean-Square;
- Training set:
 - m input units x ,
 - n desired output units t ,
 - I patterns of the type $((x_1, \dots, x_m), (t_1, \dots, t_n))$.

Rosa, J. L. G. 29

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Learning algorithm LMS

- The I training patterns presented to the network;
- An error measurement produced by the network;
- The error is function of:
 - each pattern, and
 - error produced in each output unit, when each pattern is presented.

Rosa, J. L. G. 30

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Learning algorithm LMS

- If...
 - the network learns perfectly the training patterns, and
 - the training patterns reflect perfectly the task that is intended to learn;
- Then...
 - after training, the error will be zero.

Rosa, J. L. G. 31

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Learning algorithm LMS

- The error comes from the differences between real and desired outputs → consequence of the output produced by incorrect weights (and biases);
- To learn = to find the weights which make the error minimum.

Rosa, J. L. G. 32

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Learning algorithm LMS

- The total error E after training is:

$$E(w) = \sum_{p=1}^l E_p$$
 - where E_p is the error produced when the p -th training pattern is presented to the network;
- The most popular error measurement → mean quadratic error:

$$E_p(w) = \frac{1}{2} \sum_{k=1}^n (t_k - y_k)^2$$

Rosa, J. L. G.

33

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

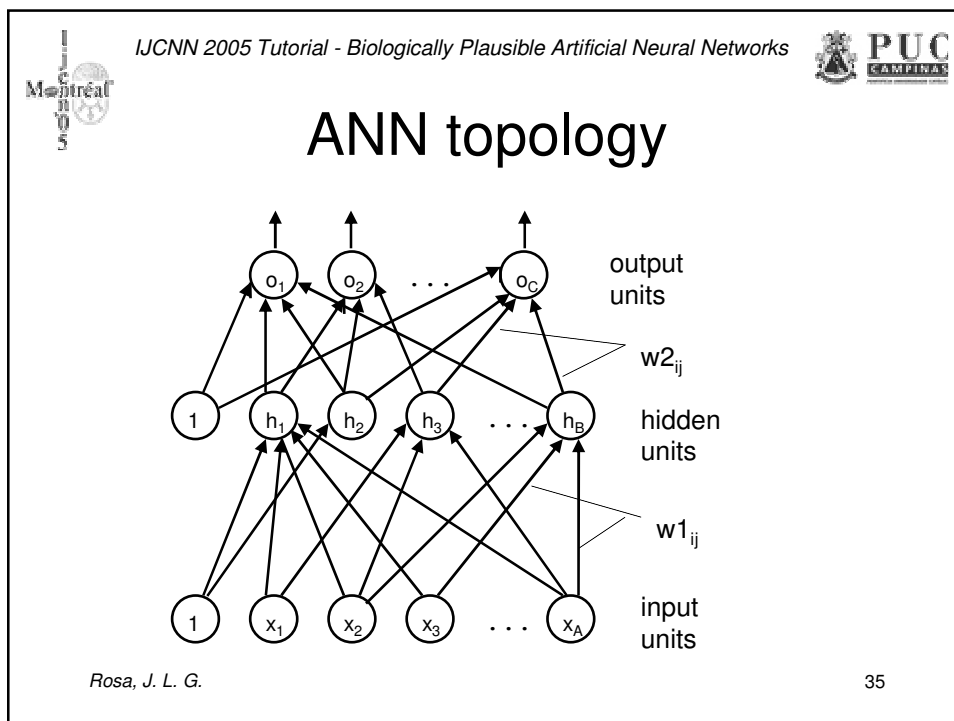

Neural network topology

- In cerebral cortex:
 - neurons disposed in columns,
 - most synapses occur between different columns;
- In the extremely simplified mathematical model:
 - neurons disposed in layers (representing columns),
 - there is communication between neurons in different layers.

Rosa, J. L. G.

34

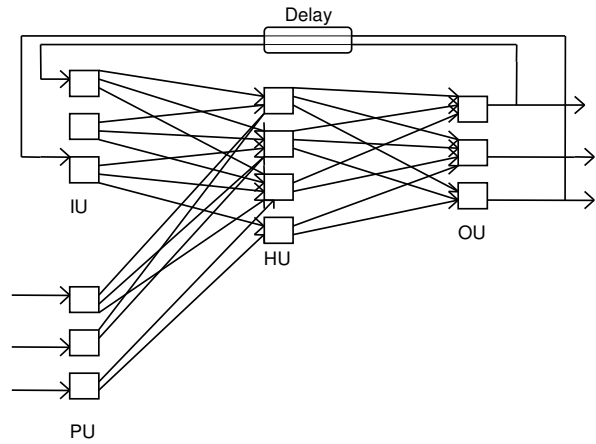

- IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks
-
- ANN topology**
- Types of connectionist networks:
 - feed forward multi-layer,
 - recurrent multi-layer:
 - at least one feedback loop, at the same unit, or between layers.
- Rosa, J. L. G. 36

Elman's recurrent network

(Source: Elman, 1988)

Rosa, J. L. G. 38

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Classical ANN Models

- Based upon a simple description of the neuron, taking into account:
 - the presence of presynaptic cells and their synaptic potentials,
 - the activation threshold, and
 - the propagation of an action potential;
- Represent impoverished explanation of human brain characteristics.

Rosa, J. L. G. 39

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Advantages of ANNs

- Naturally parallel solution,
- Robust, fault tolerant,
- Allow integration of information from different sources or kinds,
- Adaptive systems, that is, capable of learning,
- Show a certain autonomy degree in learning,
- Display a very fast recognizing performance.

Rosa, J. L. G. 40

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Limitations of ANNs

- Still very hard to explain its behavior, because of lacking of transparency;
- Solutions do not scale well ...
 - computationally expensive for big problems;
- Yet very far from biological reality.

Rosa, J. L. G. 41

Inspiration

“Almost all aspects of life are engineered at the molecular level, and without understanding molecules we can only have a sketchy understanding of life itself.”

Francis Crick, *What Mad Pursuit*, 1988.

Rosa, J. L. G. 43

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Human brain

- Natural evolution endowed human brain with many desirable characteristics, not present in von Neumann machine:
 - massive parallelism,
 - distributed representation and computation,
 - learning ability,
 - generalization ability,
 - adaptability,
 - inherent contextual information processing,
 - fault tolerance,
 - low energy consumption.

Synapse

The diagram illustrates the molecular components of a synapse. On the left, a synaptic transmitter molecule (represented by a T-shaped structure) is shown above a receptor molecule (represented by a U-shaped structure). In the center, a transmitter-receptor complex is formed where the transmitter molecule is bound to the receptor molecule. On the right, the synaptic transmitter molecule is shown above the synaptic cleft, which is the space between the presynaptic and postsynaptic membranes. The postsynaptic membrane is shown with a receptor molecule embedded in it. The intracellular space is labeled below the postsynaptic membrane.

(from Biello, 2005)

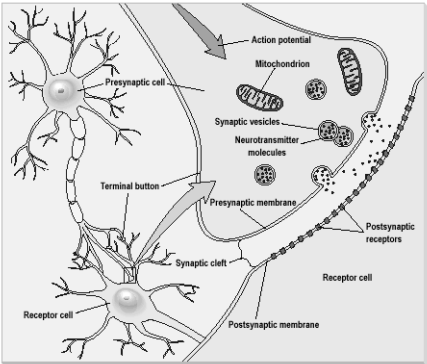

Rosa, J. L. G. 57

ICANN 2005 Montreal

PUC CAMPINAS

Synapse

The diagram shows a presynaptic cell with a terminal button at the end of its axon. Inside the terminal button, there are mitochondria and synaptic vesicles containing neurotransmitter molecules. An action potential is shown as a pulse of electrical activity traveling down the axon. The presynaptic membrane is the boundary of the terminal button. The synaptic cleft is the space between the presynaptic membrane and the postsynaptic membrane. The postsynaptic membrane is the boundary of the postsynaptic cell, which contains postsynaptic receptors. The receptor cell is the postsynaptic cell.

(from Biello, 2005)

Rosa, J. L. G. 58

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Synapse

- The synapse can be:
 - Type I – Excitatory (A): neurons contribute to produce impulses on other cells;
 - Type II – Inhibitory (B): neurons prevent the releasing of impulses on other cells.

Rosa, J. L. G.

59

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Synapse

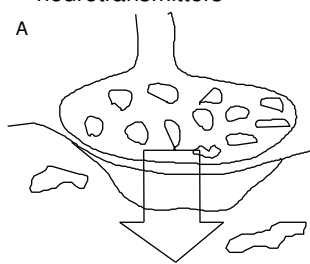

EXCITATORY SYNAPSE:

- asymmetrical membrane specializations,
- very large synaptic vesicles (50 nm) with packets of neurotransmitters

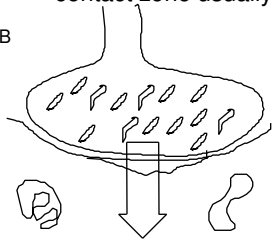

INHIBITORY SYNAPSE:

- symmetrical membrane specializations,
- synaptic vesicles are smaller and often ellipsoidal or flattened,
- contact zone usually smaller

Computation in CNS

- Input connections:
 - about 500 (retinal ganglion cells),
 - about 200,000 (purkinje cells);
- Hundreds or thousands of different kinds of neurons:
 - massively parallel,
 - very simple processing elements,
 - more than 100 billion neurons in human brain,
 - at least 100 trillion synapses,
 - 72 km of fiber,
 - 100 different kinds of neurotransmitters.

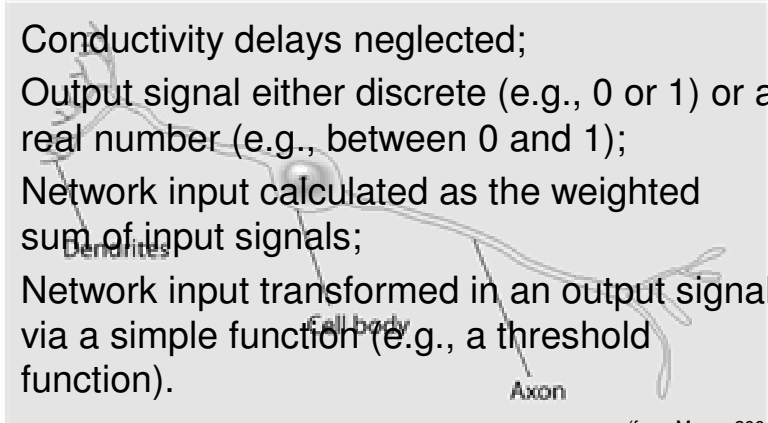

Rosa, J. L. G. (source: Eliasmith and Anderson, 2002) 63

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

ANNs do not focus on real neuron details

- Conductivity delays neglected;
- Output signal either discrete (e.g., 0 or 1) or a real number (e.g., between 0 and 1);
- Network input calculated as the weighted sum of input signals;
- Network input transformed in an output signal via a simple function (e.g., a threshold function).

Donald Olding Hebb

Rosa, J. L. G. 66

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Donald Hebb (1949)

“When an axon of cell A is near enough to excite a cell B and repeatedly or persistently takes part in firing it, some growth process or metabolic change takes place in one or both cells such that A’s efficiency, as one of the cells firing B, is increased.”

(source: Hebb, 1949)

Rosa, J. L. G. 67

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Donald Hebb (1949)

- Also, the word *connectionism* appeared for the first time:

“The theory is evidently a form of connectionism, one of the switchboard variety, though it does not deal in direct connections between afferent and efferent pathways: not an ‘S-R’ psychology, if R means a muscular response. The connections server rather to establish autonomous central activities, which then are the basis of further learning”

Rosa, J. L. G. 68

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Hebb hypothesis

- Knowledge: associations;
- Plasticity in CNS:
 - synapses: created and destroyed,
 - synaptic weights change values,
 - allow learning:
 - internal self-organizing:
 - encoding of new knowledge,
 - reinforcement of existent knowledge.

Rosa, J. L. G. 69

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Hebb hypothesis

- How to supply a neural substrate to association learning among world facts?
- Hebb hypothesis (1949):
 - connections between two nodes highly activated at the same time are reinforced,
 - this kind of rule is a formalization of the associationist psychology:
 - associations accumulated among things that happen together.

Rosa, J. L. G. 70

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Hebb hypothesis

- Permits to model the CNS plasticity, adapting it to environmental changes, through:
 - excitatory and inhibitory strength of existing synapses, and
 - its topology;
- Allows that a connectionist network learns correlation among facts.

Rosa, J. L. G. 71

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Connectionist systems are able to learn

- Connectionist networks learn:
 - through synaptic weight change:
 - statistical correlations from the environment;
 - through network topology change (in a few models);
- Probabilistic reasoning: without a statistical model of the problem.

Rosa, J. L. G. 72

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Two learning methods are possible with Hebbian learning

- Unsupervised learning,
- Supervised learning;
- In *unsupervised learning* there is no teacher:
 - the network tries to find regularities in the input patterns.

Rosa, J. L. G. 73

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Two learning methods are possible with Hebbian learning

- In *supervised learning*, input associated with output:
 - if input = output \rightarrow *auto-associative* learning,
 - if input \neq output \rightarrow *hetero-associative* learning.

Rosa, J. L. G. 74

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

 

Break

Rosa, J. L. G. 75

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Part 2

- **Back-propagation**
- Generalized recirculation
- Connectionist representations
- Intraneuron and interneuron signaling
- A biologically plausible ANN model proposal
- Conclusions

Rosa, J. L. G. 76

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Back-propagation

- Supervised algorithm for multilayer networks
 - applies the generalized delta rule;
 - requires two passes of computation:
 - activation propagation (forward pass),
 - error back propagation (backward pass).

Rosa, J. L. G. 77

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Back-propagation

1. Propagate the activation:
 - from input to hidden layer,
 - from hidden to output layer;
2. Calculate the error:
 - for output units,
 - back propagate the error to hidden units and then to input units;
 - passes 1 and 2 constitute a cycle.

Rosa, J. L. G. 78

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Back-propagation

- The problems with BP:
 - computationally expensive (slow),
 - does not solve satisfactorily big size problems,
 - sometimes, the solution found is a local minimum – a locally minimum value for the error function.

Rosa, J. L. G. 79

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Back-propagation

- Advantages of BP:
 - universal approximation power:
 - given a continuous function, there is a two-layer network (one hidden layer) that can be trained by Back-propagation in order to approximate as much as desired this function,
 - the most used algorithm.

Rosa, J. L. G. 80

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

The biological implausibility of Back-propagation

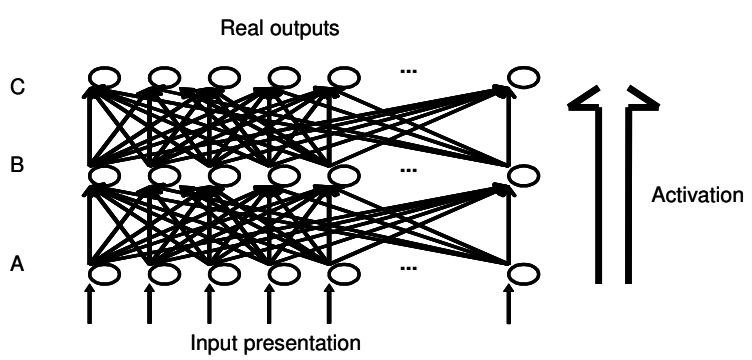

- BP is considered biologically implausible:
 - the reason: based on the error back propagation:
 - stimulus propagates forwardly,
 - error (difference between the actual and the desired outputs) propagates backwardly.

Rosa, J. L. G.
81

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

The biological implausibility of Back-propagation

Rosa, J. L. G.
82

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

The biological implausibility of Back-propagation

The diagram illustrates a feedforward neural network with three layers labeled A, B, and C. Layer C is the top layer, B is the middle layer, and A is the bottom layer. Each layer contains several nodes (circles). Arrows point down to each node in layer C, labeled 'Desired outputs'. The nodes in layer C are connected to nodes in layer B, which are in turn connected to nodes in layer A. To the right of the network, two large downward-pointing arrows are labeled 'Error', indicating the back-propagation of error signals from the output layer back through the hidden layers.

Rosa, J. L. G. 83

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

The biological implausibility of Back-propagation

- In the cerebral cortex:
 - stimulus generated when a neuron fires → crosses the axon towards its end → to make a synapse onto another neuron input.

Rosa, J. L. G. 84

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks 

 **The biological implausibility of Back-propagation**

- Suppose that BP occurs in the brain:
 - the error must have to propagate back:
 - from the dendrite of the postsynaptic neuron,
 - to the axon and
 - then to the dendrite of the presynaptic neuron;
 - It sounds unrealistic and improbable.

Rosa, J. L. G. 85

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks 

 **The biological implausibility of Back-propagation**

- Synaptic “weights” have to be modified in order to make learning possible:
 - but certainly not in the way BP does,
 - weight change must use only local information in the synapse where it occurs,
 - that’s why BP seems to be so biologically implausible.

Rosa, J. L. G. 86

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Part 2

- Back-propagation
- **Generalized recirculation**
- Connectionist representations
- Intra-neuron and inter-neuron signaling
- A biologically plausible ANN model proposal
- Conclusions

Rosa, J. L. G. 87

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

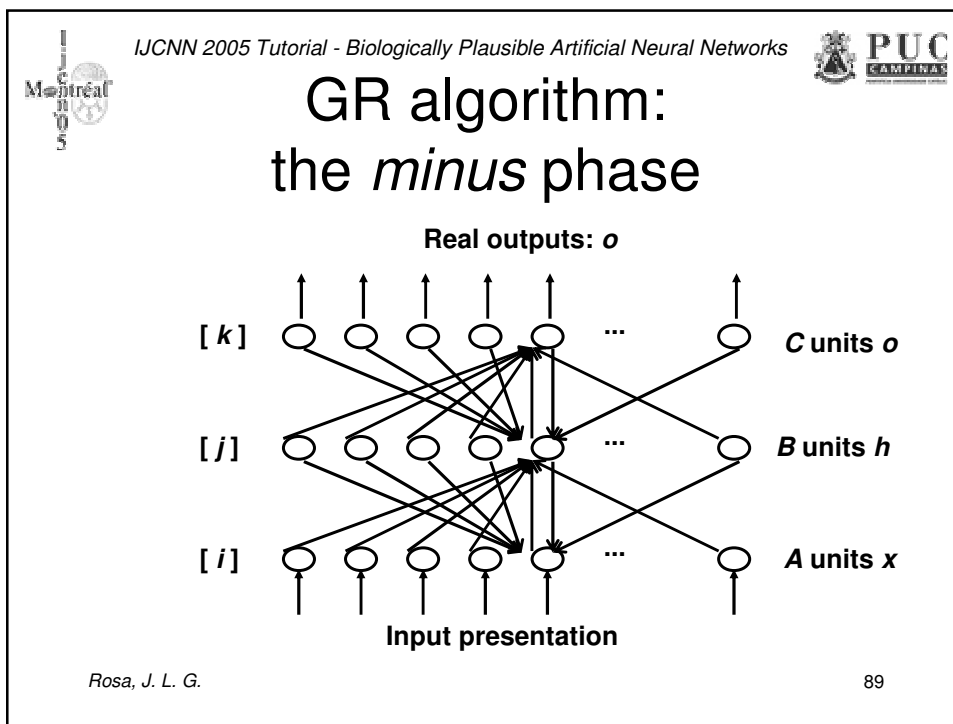

Generalized Recirculation algorithm*

- Supervised connectionist algorithm based on BP,
- Bi-directional architecture,
- Argued to be biologically more plausible,
- Consists of two phases: the *minus* and the *plus* phase.

- A biologically plausible ANN model proposal
- Conclusions

Rosa, J. L. G.

94

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Connectionist representation

- Need for representation → to receive information from and send information to the environment;
- Two types:
 - external representation:
 - used in input and output units,
 - internal representation:
 - associated to the hidden units.

Rosa, J. L. G. 95

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Connectionist representation

- External representation:
 - localist representation:
 - each entity or concept or feature → represented by only one processing unit,
 - the semantics of a unit → independent from the interpretations associated to other units,
 - less biologically plausible,
 - less economic in resources,
 - does not represent similarities between concepts.

Rosa, J. L. G. 96

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Connectionist representation

– distributed representation:

- each entity → represented by one activation pattern distributed among more than one unit,
- each unit → takes part in the representation of more than one entity,
- the interpretation of a given representation → obtained from the analysis of the activation global pattern of several units,
- the interpretation of the activation of one unit can make no sense.

Rosa, J. L. G. 97

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Connectionist representation

– distributed representation (continuation):

- the semantics associated is not compositional,
- more biologically plausible,
- more economic,
- much greater representational power → allows to represent similarities among concepts,
- radically different from symbolic representations.

Rosa, J. L. G. 98

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Connectionist representation

- The choice of external information representation is a key point in modeling:
 - connectionist networks capture statistical regularities present in the environment (training set),
 - the network only captures the information that the external representation can code,
 - the external representation can be the difference between learning or not.

Rosa, J. L. G. 99

Ramón y Cajal

- Principle of connectional specificity:
 - “nerve cells do not communicate indiscriminately with one another or form random networks”;
- Principle of dynamic polarization:
 - “electric signals inside a nervous cell flow only in a direction: from neuron reception (often the dendrites and cell body) to the axon trigger zone”.

Rosa, J. L. G.

102

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Intraneuron signaling

- Based on the principle of dynamic polarization, proposed by Ramón y Cajal;
- The signaling inside the neuron is performed by four basic elements:
 - receptive,
 - trigger,
 - signaling,
 - secretor.

Rosa, J. L. G. 103

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Intraneuron signaling

- *Receptive*: responsible for input signals → related to the dendritic region;
- *Trigger*: responsible for neuron activation threshold → related to the soma;
- *Signaling*: responsible for conducting and keeping the signal → related to the axon; and
- *Secretor*: responsible for signal releasing to another neuron → related to the presynaptic terminals of the biological neuron.

Interneuron signaling

- Electrical and chemical synapses:
 - have completely different morphologies.

Rosa, J. L. G. 107

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

The electrical synapse

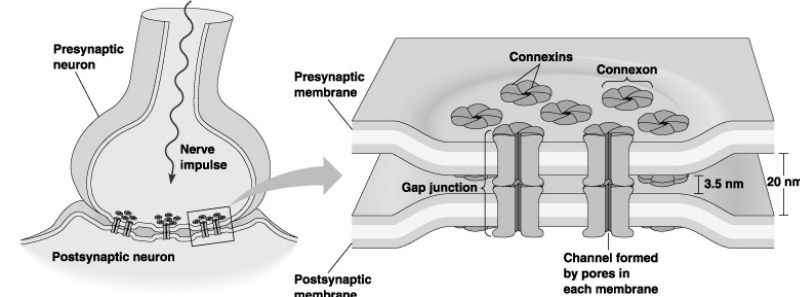

- At electrical synapses:
 - transmission occurs through gap junction channels (special ion channels),
 - located in the pre and postsynaptic cell membranes → cytoplasmatic connection between cells;
 - part of electric current injected in presynaptic cell escapes through resting channels;
 - remaining current driven to the inside of the postsynaptic cell through gap junction channels.

Rosa, J. L. G. 108

Rosa, J. L. G. 109

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

The chemical synapse

- At chemical synapses:
 - synaptic cleft: small cellular separation between the cells;
 - vesicles containing neurotransmitter molecules in the presynaptic terminal;
 - when action potential reaches these synaptic vesicles → neurotransmitters released to the synaptic cleft.

Rosa, J. L. G. 110

ICJNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

McGill PUC CAMPINAS

The chemical synapse

The diagram illustrates the structure of a chemical synapse. On the left, a presynaptic axon is shown with an arrow indicating the direction of presynaptic nerve impulses. This axon terminates in a synaptic knob, which contains several synaptic vesicles containing neurotransmitter molecules and a mitochondrion. The synaptic knob is bounded by a presynaptic membrane. The synaptic knob is separated from the post-synaptic membrane by a synaptic cleft. On the right, a magnified view of the synaptic cleft shows synaptic vesicles moving towards the presynaptic membrane, where they release neurotransmitter molecules into the cleft. These molecules then bind to post-synaptic membrane receptors on the post-synaptic membrane.

(from MUN, 2005)

Rosa, J. L. G. 111

ICJNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

McGill PUC CAMPINAS

The chemical synapse

The diagram illustrates the process of neurotransmitter release at a chemical synapse. Part A shows a synaptic vesicle containing neurotransmitter molecules and a mitochondrion moving towards the synaptic cleft. The vesicle is shown fusing with the presynaptic membrane, releasing neurotransmitter molecules into the synaptic cleft. Part B shows the neurotransmitter molecules binding to receptors on the muscle cell membrane, which is labeled as the end-plate membrane. The receptors are labeled as ACh receptor molecules. The muscle cell is labeled as muscle fiber.

Part 2

- Back-propagation
- Generalized recirculation
- Connectionist representations
- Intra-neuron and inter-neuron signaling
- **A biologically plausible ANN model proposal**
- Conclusions

Rosa, J. L. G. 113

ICNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

A biologically plausible ANN model proposal

- Proposal for a biologically plausible model (Rosa, 2001):
 - to present a mechanism to generate a biologically plausible ANN model;
 - to redesign the classical framework to encompass:
 - the traditional features,
 - labels that model the binding affinities between transmitters and receptors.

Rosa, J. L. G. 114

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

A biologically plausible ANN model proposal

- Departs from a classical connectionist model;
- Defined by a restricted data set, which explains the ANN behavior;
- Introduces T, R, and C variables → to account for the binding affinities between neurons (unlike other models).

Rosa, J. L. G. 115

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

A biologically plausible ANN model proposal

- The following feature set defines the neurons:

$$N = \{\{w\}, \theta, g, T, R, C\}$$
 where:
 - w represents the connection weights,
 - θ is the neuron activation threshold,
 - g stands for the activation function,
 - T symbolizes the transmitter,
 - R the receptor, and
 - C the controller.
- $\theta, g, T, R,$ and $C \rightarrow$ genetic information,
- T, R, and C \rightarrow labels, absent in other models.

Rosa, J. L. G. 116

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

A biologically plausible ANN model proposal

- Follows Ramón y Cajal's *principle of connectional specificity*:
 - each neuron connected to another neuron:
 - not only in relation to $\{w\}$, θ , and g ,
 - but also in relation to T, R, and C;
 - neuron i is only connected to neuron $j \rightarrow$ if there is binding affinity between the T of i and the R of j .

Rosa, J. L. G. 117

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

A biologically plausible ANN model proposal

- binding affinity means:
 - compatible types,
 - enough amount of substrate, and
 - compatible genes;
- $T + R = C$;
- C can act over other neuron connections.

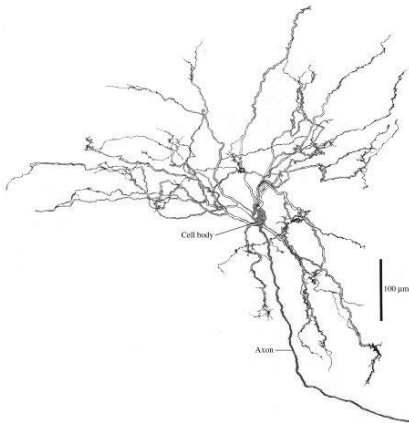

Rosa, J. L. G. 118

Rosa, J. L. G. 119

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

ICANN 2005 Montreal

PUC CAMPINAS

The ordinary biological neuron

- Presents:
 - many dendrites usually branched → receive information from other neurons,
 - an axon → transmits the processed information → usually by propagation of an action potential;
 - the axon → divided into several branches → make synapses onto the dendrites and cell bodies of other neurons.

Rosa, J. L. G. 120

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Chemical synapse is predominant

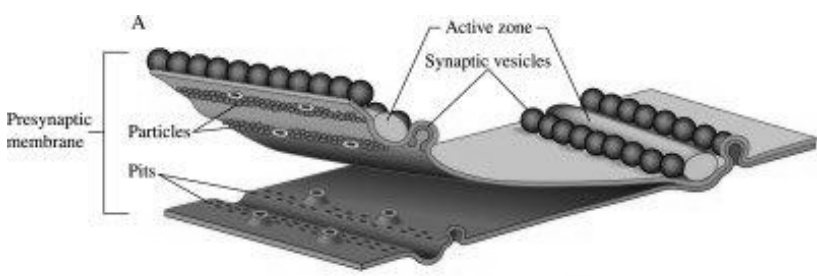

- Release of transmitter substance occurs in active zones, inside presynaptic terminals;
- Certain chemical synapses lack active zones → synaptic actions between cells are slower and more diffuse;
- neurotransmitter + receptor → makes the postsynaptic cell release a protein.

Rosa, J. L. G.
121

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Active zone and synaptic vesicles

The diagram illustrates the structure of a chemical synapse. It shows a presynaptic membrane (labeled 'A') containing synaptic vesicles. An active zone is indicated on the membrane. Labels include: Presynaptic membrane, Particles, Pits, Active zone, and Synaptic vesicles.

Rosa, J. L. G.
122

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Morphological synapses

- Although type I synapses seem to be excitatory and type II synapses inhibitory:
 - the action of a transmitter in the postsynaptic cell:
 - does not depend → chemical nature of the neurotransmitter,
 - depends → properties of the receptors with which the transmitter binds.

Rosa, J. L. G. 123

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Morphological synapses

- in some cases, it is the receptor that determines whether:
 - a synapse is excitatory or inhibitory, and
 - an ion channel will be activated:
 - directly by the transmitter or
 - indirectly through a second messenger.

Rosa, J. L. G. 124

Second messengers

```
graph TD; A[① Neurotransmitter is released by presynaptic neuron] --> B[② Neurotransmitter combines with specific receptor in membrane of postsynaptic neuron]; B --> C[③ Combination of neurotransmitter with receptor leads to intracellular release or production of a second messenger]; C --> D[④ Second messenger interacts (directly or indirectly) with ion channel, causing it to open or close];
```

① Neurotransmitter is released by presynaptic neuron

② Neurotransmitter combines with specific receptor in membrane of postsynaptic neuron

③ Combination of neurotransmitter with receptor leads to intracellular release or production of a second messenger

④ Second messenger interacts (directly or indirectly) with ion channel, causing it to open or close

Rosa, J. L. G.

126

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Graded potentials

- 2 types of signaling:
 - propagation of action potential,
 - production of a graded potential by the axon;
- Graded potential signaling does not occur over long distances → because of attenuation.

Rosa, J. L. G.
127

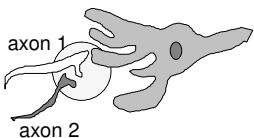

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Graded potentials can occur in another level

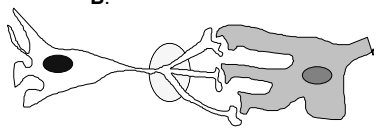

axon 1 makes synapse in a given cell can receive a synapse from axon 2

A.

axon 1
axon 2

B.

the presynaptic synapse can produce only a local potential change, which is then restricted to that axon terminal.

(from Crick and Asanuma, 1986)

Rosa, J. L. G.
128

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

A biologically plausible ANN model proposal

- In view of these biological facts, it was decided to model through:
 - labels T and R:
 - the binding affinities between Ts and Rs;
 - label C:
 - the role of the “second messenger”,
 - the effects of graded potential, and
 - the protein released by the coupling of T and R.

Rosa, J. L. G. 129

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

The roles of the controller

- C can modify the binding affinities between neurons by modifying:
 - degrees of affinity of receptors,
 - amount of substrate (amount of transmitters and receptors),
 - gene expression, in case of mutation.

Rosa, J. L. G. 130

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Degrees of affinity modification

- Degrees of affinity are related to the way receptors gate ion channels at chemical synapses;
- Through ion channels transmitter material enters the postsynaptic cell:
 - in direct gating: receptors produce relatively fast synaptic actions,
 - in indirect gating: receptors produce slow synaptic actions:
 - these slower actions often serve to *modulate* behavior because they modify the degrees of affinity of receptors.

Rosa, J. L. G. 131

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Degrees of affinity modification

- In addition, modulation can be related to the action of peptides;
- Peptides: compound consisting of two or more amino acids, the building blocks of proteins;
- There are many distinct peptides, of several types and shapes, that can act as neurotransmitters.

Rosa, J. L. G. 132

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Degrees of affinity modification

- Peptides are different from many conventional transmitters:
 - “modulate” synaptic function instead of activating it,
 - spread slowly and persist for some time, much more than conventional transmitters, and
 - do not act where released, but at some distant site (in some cases).

Rosa, J. L. G. 133

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Degrees of affinity modification

- As transmitters, peptides:
 - act at very restricted places,
 - display a slow rate of conduction, and
 - do not sustain the high frequencies of impulses.

Rosa, J. L. G. 134

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Degrees of affinity modification

- As neuromodulators:
 - the excitatory effects of substance P (a peptide) → very slow in the beginning → longer in duration (more than one minute),
 - cannot cause enough depolarization to excite the cells;
 - the effect is to make neurons more readily excited by other excitatory inputs – “neuromodulation”.

Rosa, J. L. G. 135

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Degrees of affinity modification

- In this model:
 - C explains this function by modifying the degrees of affinity of receptors.

Rosa, J. L. G. 136

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Amount of substrate modification

- In biological systems:
 - acetylcholine (a neurotransmitter):
 - spread over a short distance →
 - toward the postsynaptic membrane →
 - acting at receptor molecules in that membrane →
 - enzymatically divided →
 - part of it is taken up again for synthesis of a new transmitter →
 - an increase in the amount of substrate.

Rosa, J. L. G. 137

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Amount of substrate modification

- In this model:
 - C represents substrate increase by a variable acting over initial substrate amount.

Rosa, J. L. G. 138

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Gene expression modification

- Peptides are a second, slower, means of communication between neurons
 - more economical than using extra neurons;
- This second messenger:
 - besides altering the affinities between transmitters and receptors,
 - can regulate gene expression → synaptic transmission with long-lasting consequences.

Rosa, J. L. G. 139

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Gene expression modification

- In this model:
 - this is achieved by modification of a variable for gene expression:
 - mutation can be accounted for.

Rosa, J. L. G. 140

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

The labels and their dynamic behaviors

A. For the network genesis:

- number of layers;
- number of neurons in each layer;
- initial amount of substrate (transmitters and receptors) in each layer; and
- genetics of each layer:
 - type of transmitter and its degree of affinity,
 - type of receptor and its degree of affinity, and
 - genes (name and gene expression)).

Rosa, J. L. G. 141

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

The labels and their dynamic behaviors

B. For the evaluation of controllers and how they act:

- Controllers can modify:
 - the degree of affinity of receptors;
 - the initial substrate storage; and
 - the gene expression value (mutation).

Rosa, J. L. G. 142

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

The labels and their dynamic behaviors

- Specifications lead to ANN with some distinctive characteristics:
 - each neuron has a genetic code:
 - a set of genes plus a gene expression controller;
 - controller can cause *mutation*:
 - because it can regulate gene expression.

Rosa, J. L. G. 143

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

The labels and their dynamic behaviors

- substrate (amount of transmitter and receptor) defined by layer;
- substrate amounts limited:
 - some postsynaptic neurons not activated;
- network favors *clustering*.

Rosa, J. L. G. 144

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Part 2

- Back-propagation
- Generalized recirculation
- Connectionist representations
- Intra-neuron and inter-neuron signaling
- A biologically plausible ANN model proposal
- **Conclusions**

Rosa, J. L. G. 145

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Conclusions

- Current models of ANN in debt with human brain physiology;
- Conventional ANN models are too simple:
 - because of mathematical simplicity,
 - lack several biological features of the cerebral cortex;
- Objective:
 - to present a biologically plausible ANN model, closer to human brain capacity.

Rosa, J. L. G. 146

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Conclusions

- In the model, the possibility of connections between neurons is related not only to:
 - synaptic weights,
 - activation threshold, and
 - activation function,
- but also to:
 - labels that embody the binding affinities between transmitters and receptors.

Rosa, J. L. G. 147

IJCNN 2005 Tutorial - Biologically Plausible Artificial Neural Networks

Conclusions

- This type of ANN would be closer to human evolutionary capacity:
 - a genetically well-suited model of the brain;
- The hypothesis of the “dynamic core” (Edelman and Tononi, 2000) is also contemplated:
 - the model allows reentrancy in its architecture connections.

Rosa, J. L. G. 148
