

Supporting Lawful Intercept in IP-based Networks

Matt Holdrege

**Chair of the International Softswitch Consortium
Legal Intercept Working Group**

Office of the CTO at Sonus Networks

Email: Matt@sonusnet.com.

IEEE Homeland Defense Series– March 2002

Agenda

- **What is CALEA?**
- **Safe Harbor concept**
- **Internet Protocol**
- **Softswitch Architecture**
- **State of the art**
- **International Issues**
- **Remanded Punch List Items**
- **Summary of Concerns**
- **ISC and CALEA**

CALEA

- **Communications Assistance for Law Enforcement Act**
- **1996 Act to update Law Enforcement tools for wiretapping**
- **Prompted by advances in Digital Telecommunications Services**

Types of surveillance

- LEAs may be authorized to conduct any of three specific types of surveillance:
 - "pen register" which records call-identifying information for all calls originated by a subject
 - "trap and trace" which records call-identifying information for all calls received by a subject, and
 - "interception" which allows Law Enforcement to listen to the conversations of the subject, as well as access to call-identifying information.
- Approximately 90% of all surveillance orders are of the first two types; Federal law and laws of 42 states only allow the use of the third technique in the investigation of serious criminal offenses, and when other techniques have not worked, will not work, or are too dangerous.

Safe Harbor “Industry Standards”

- **CALEA, § 107(a)**
 - “shall be found to be in compliance”
 - “publicly available technical requirements or standards adopted by an industry association or standards-setting organization”
- **CALEA, § 107(b)**
 - “Government agency or any other person” may challenge a standard
 - FCC resolves the technical challenges
 - 107(b)(5): FCC establishes compliance schedule

“Reasonably Available”

- **“call-identifying information is *reasonably available* to a carrier if it is present at an intercept access point and can be made available without the carrier being unduly burdened with network modifications” but**
- **what is “reasonably available” in a circuit-switched environment is not “reasonably available” in a Softswitch environment.**

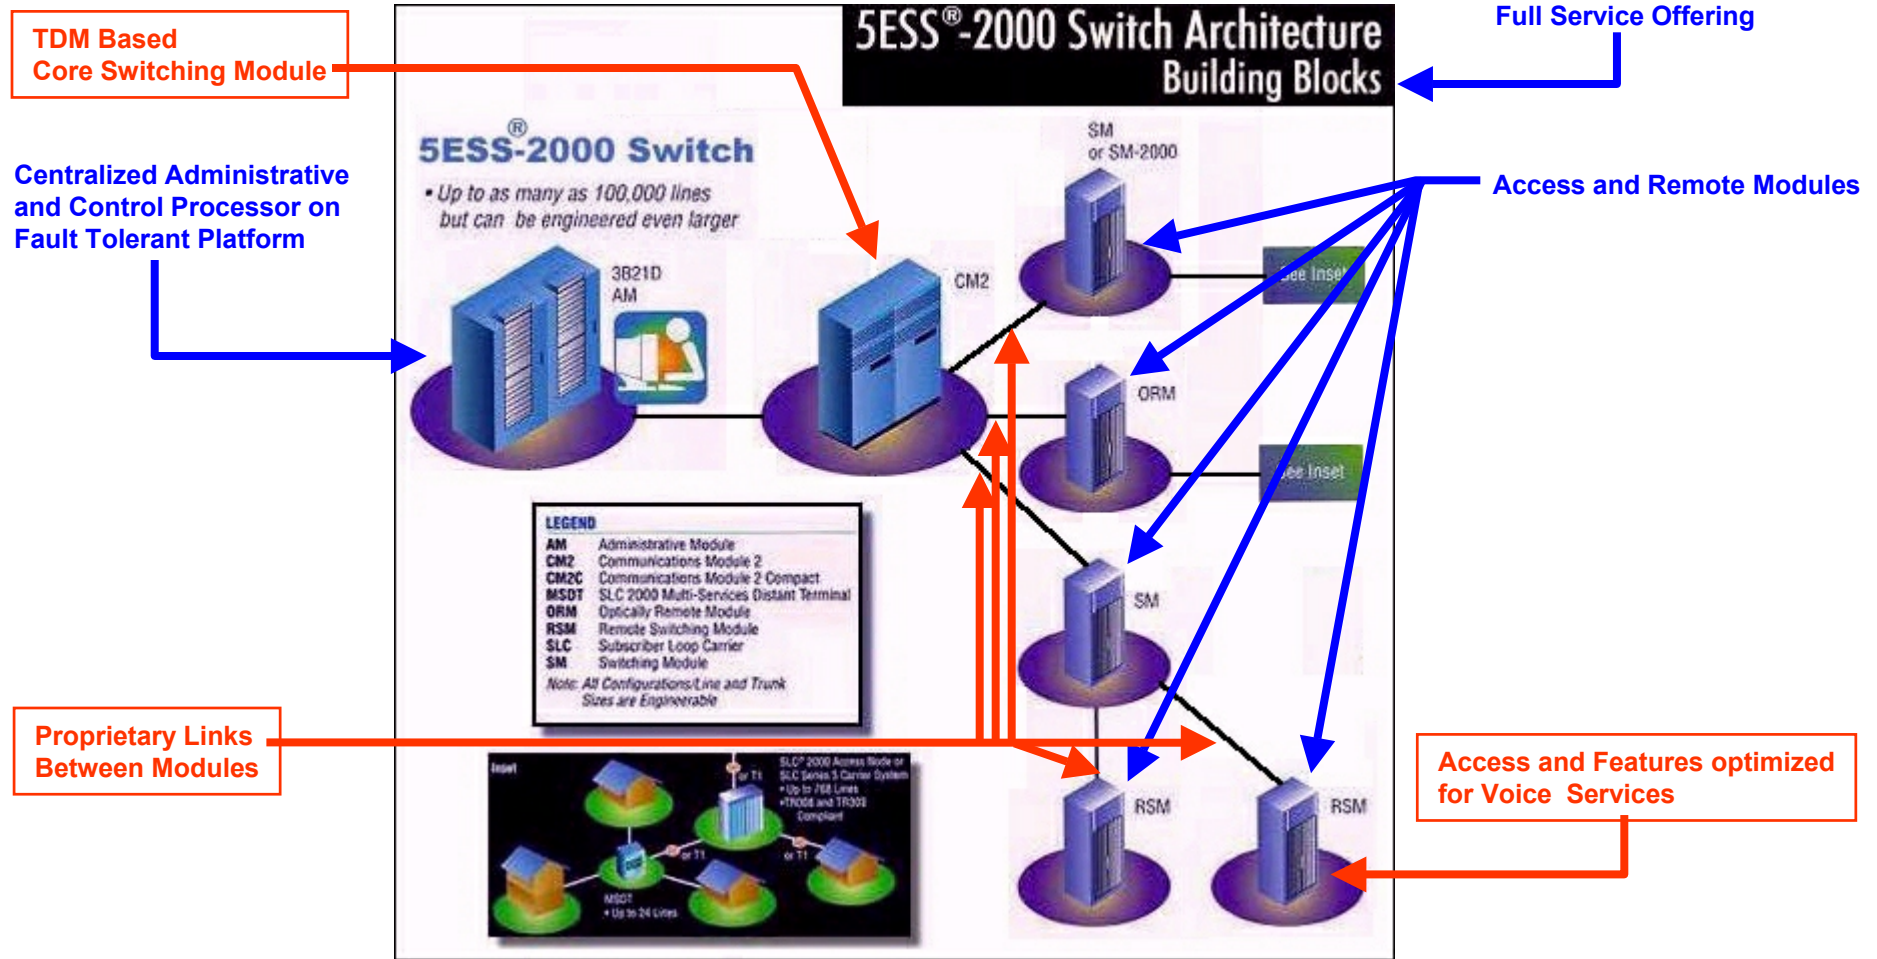

Concerns - “reasonably available”

- Providing Call Forwarding Information (easier in PSTN) - not always “*reasonably available*” in a Softswitch or SIP environment
- Dialed-Digit Extraction: “*This service permits an LEA to receive, on the call data channel, digits dialed by a subject when a call is connected to another TSP’s service for processing and routing.*” - not always “*reasonably available*” in a Softswitch or SIP environment.

Internet Protocol versus TDM

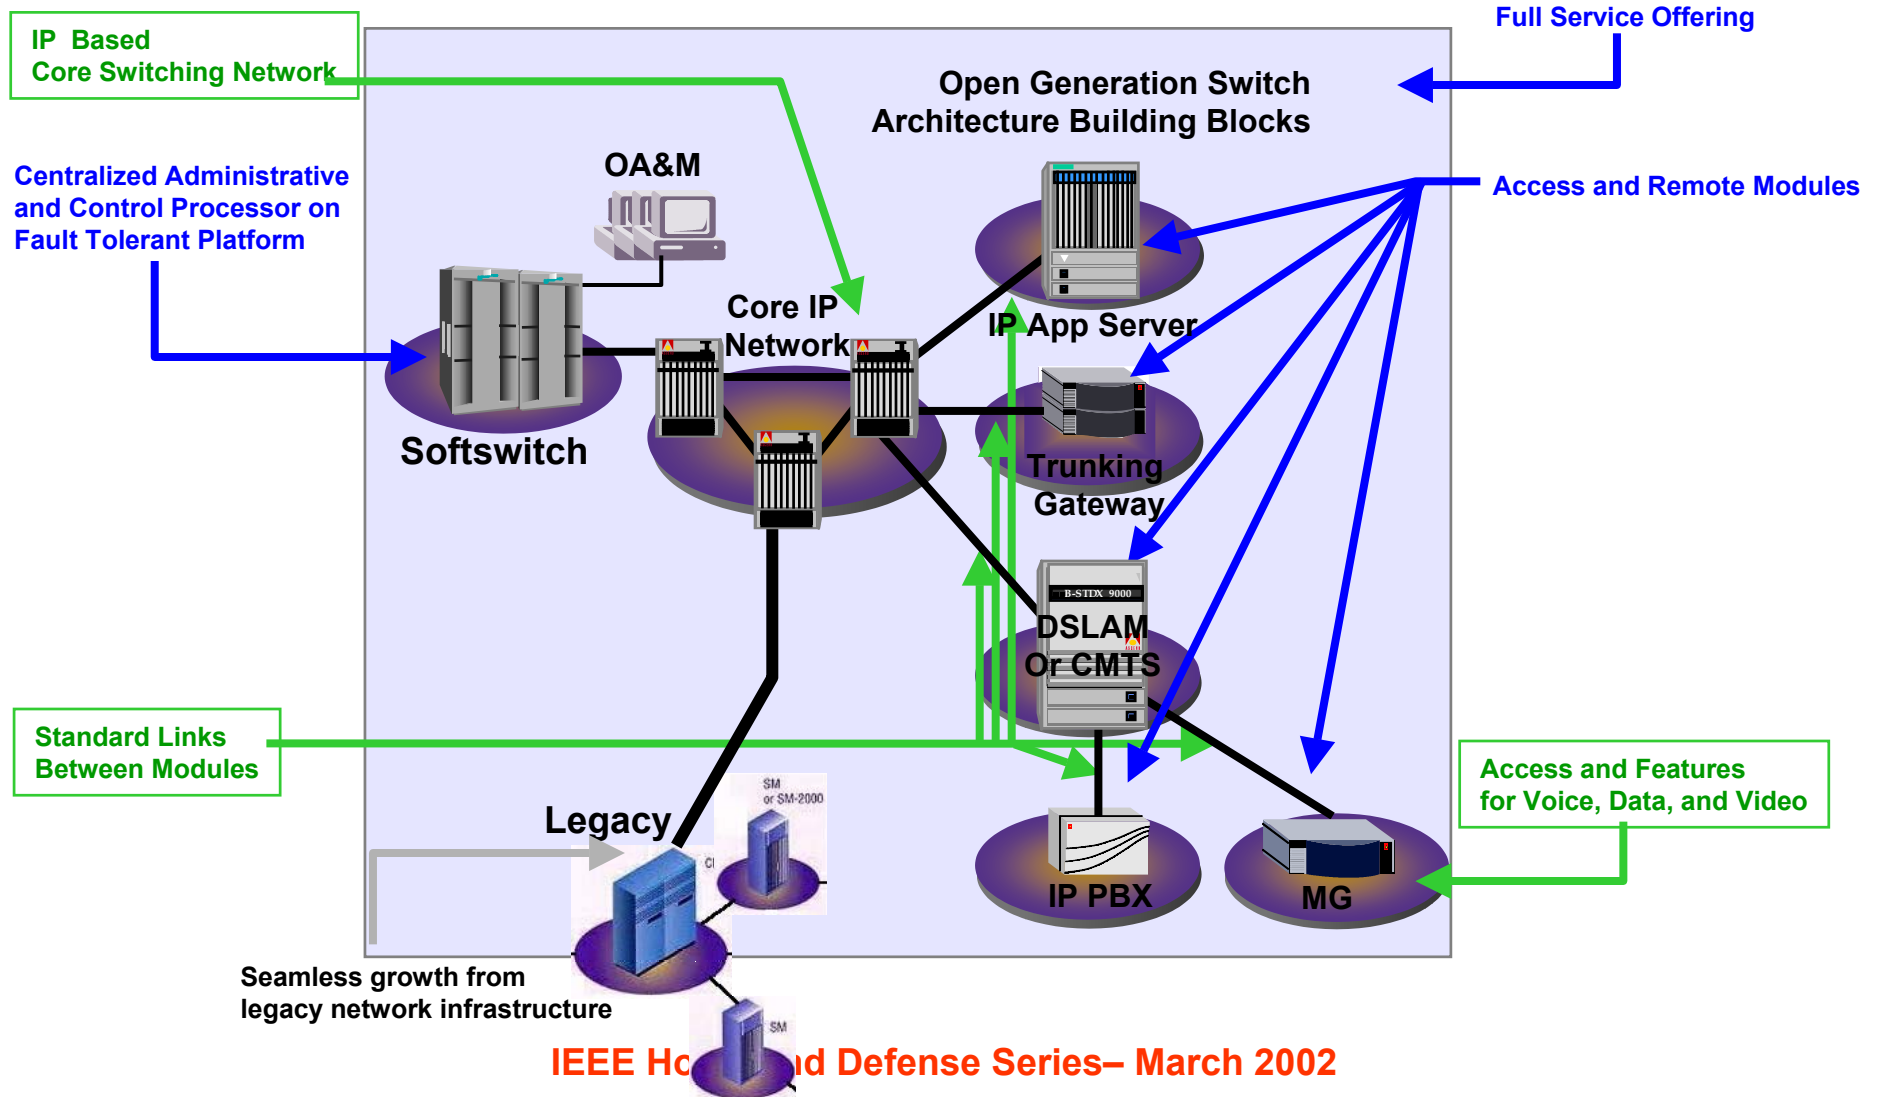

- **TDM network is connection-oriented**
- **IP is connectionless**
- **TDM circuits follow fixed paths**
- **IP packets can traverse multiple independent paths to reach their endpoint**
- **TDM has guaranteed Quality of Service**
- **IP has no inherent QoS**

Example Traditional Telecom Network Architecture

Distributed Switch Architecture

Functional Architecture

Remanded Punch List Items

- **Party-hold, party join, party drop**
- **In-band, and out of band signalling**
- **Dialed Digit Extraction**
- **Subject initiated dialing and signalling/feature info**

What is happening in Europe and elsewhere?

- **EU adopted IUR requirements in 1995 with support from the U.S. and other countries**
- **ETSI is studying LI for the purpose of standardization. It is a cooperative effort of government, operators and vendors.**
- **Certain individual countries have adopted strict rules for LI**

Issues coming at us

- **Identity? Host versus human**
- **Compensation**
- **Realistic capacity planning**
- **Roving wiretaps (mobility)**
- **More challenges**
- **More safe harbor specifications**
