REGISTER-TRANSFER LEVEL (RTL) SYSTEMS

- EXECUTION GRAPHS
- CLASSIFICATION OF EXECUTION GRAPHS
  according to sequencing structure
- ORGANIZATION OF SYSTEMS: functional and control units
- RTL SYSTEM ORGANIZATION: data and control subsystems.
- μVHDL SPECIFICATION OF RTL SYSTEMS
- REGISTER TRANSFER, REGISTER-TRANSFER GROUP,
  AND REGISTER-TRANSFER SEQUENCE
- ANALYSIS AND DESIGN PROCESS FOR RTL SYSTEMS
- DESIGN OF SERIAL-PARALLEL MULTIPLIER

REGISTER TRANSFER LEVEL (RTL)

1. DATA SUBSYSTEM (datapath) AND CONTROL SUBSYSTEM

2. THE STATE OF DATA SUBSYSTEM:
   CONTENTS OF A SET OF REGISTERS

3. THE FUNCTION OF THE SYSTEM PERFORMED AS A SEQUENCE OF REGISTER TRANSFERS (in one or more clock cycles)

4. A REGISTER TRANSFER:

   A TRANSFORMATION PERFORMED ON A DATA WHILE THE DATA TRANSFERRED FROM ONE REGISTER TO ANOTHER

5. THE SEQUENCE OF REGISTER TRANSFERS CONTROLLED BY THE CONTROL SUBSYSTEM (a sequential system)

EXAMPLE OF EXECUTION GRAPH

$$P_7(x) = \sum_{i=0}^{7} p_i x^i$$

TWO ALGORITHMS:

$$P_7(x) \;=\; ((((((p_7x + p_6)x + p_5)x + p_4)x + p_3)x + p_2)x + p_1)x + p_0$$

$$P_7(x) \;=\; (x^2)(x^2)[x^2(p_7x + p_6) + (p_5x + p_4)] + x^2(p_3x + p_2) + (p_1x + p_0)$$

Example 13.1

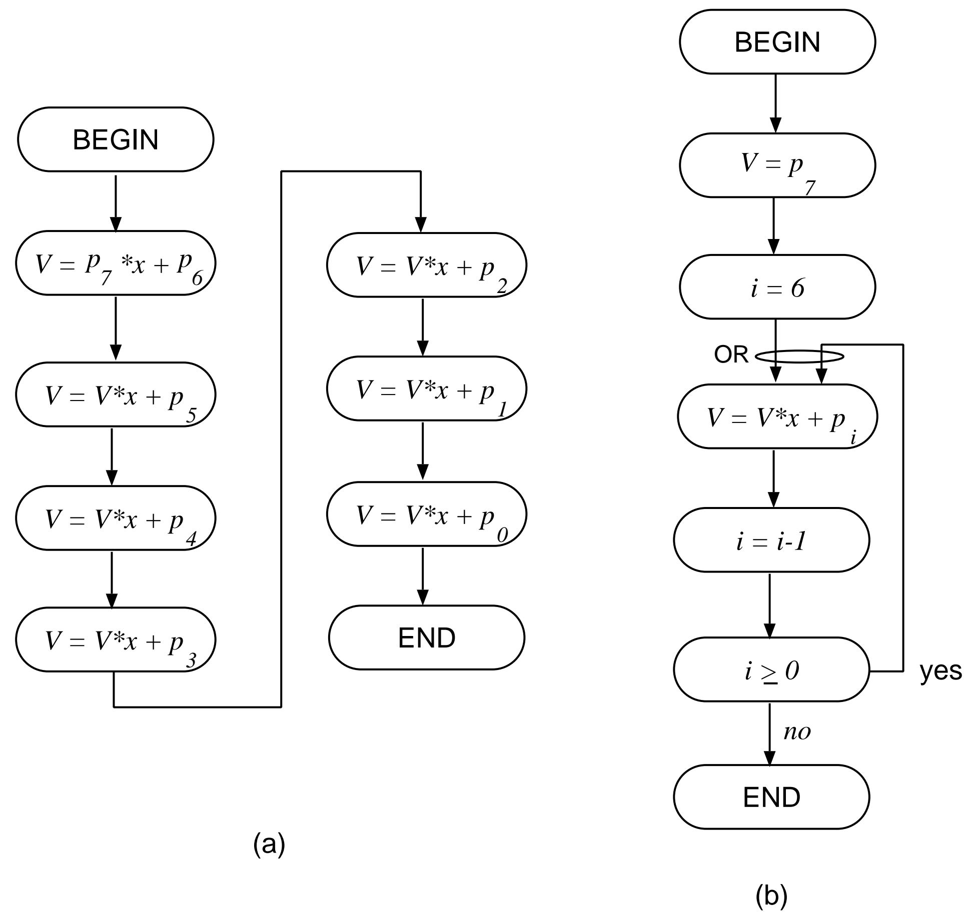

Figure 13.1: SEQUENTIAL EXECUTION GRAPHS FOR POLYNOMIAL EVALUATION: a) UNFOLDED; AND b) LOOP.

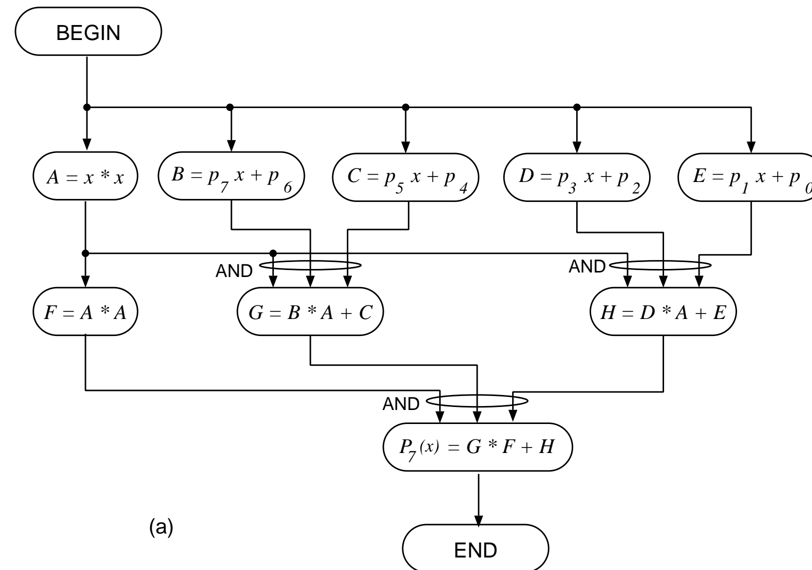

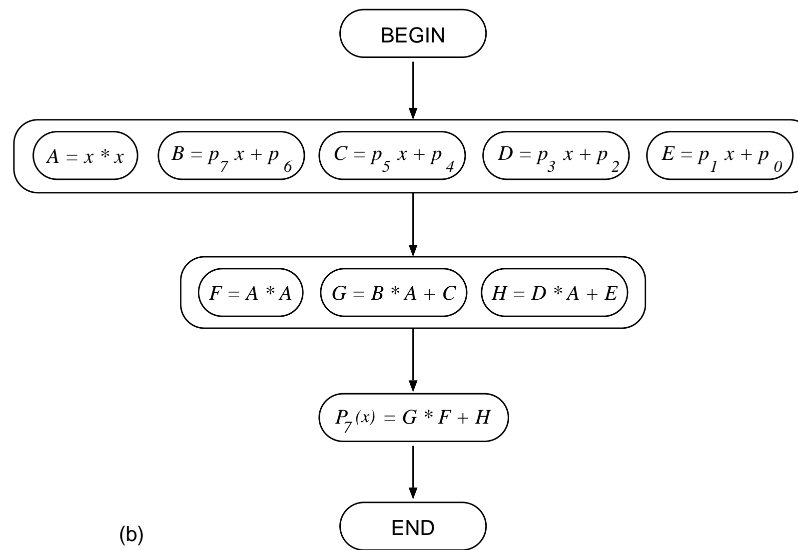

Figure 13.2: CONCURRENT EXECUTION GRAPHS FOR POLYNOMIAL EVALUATION: a) CONCURRENT; AND b) GROUP-SEQUENTIAL.

CONCURRENT INTO SEQUENTIAL

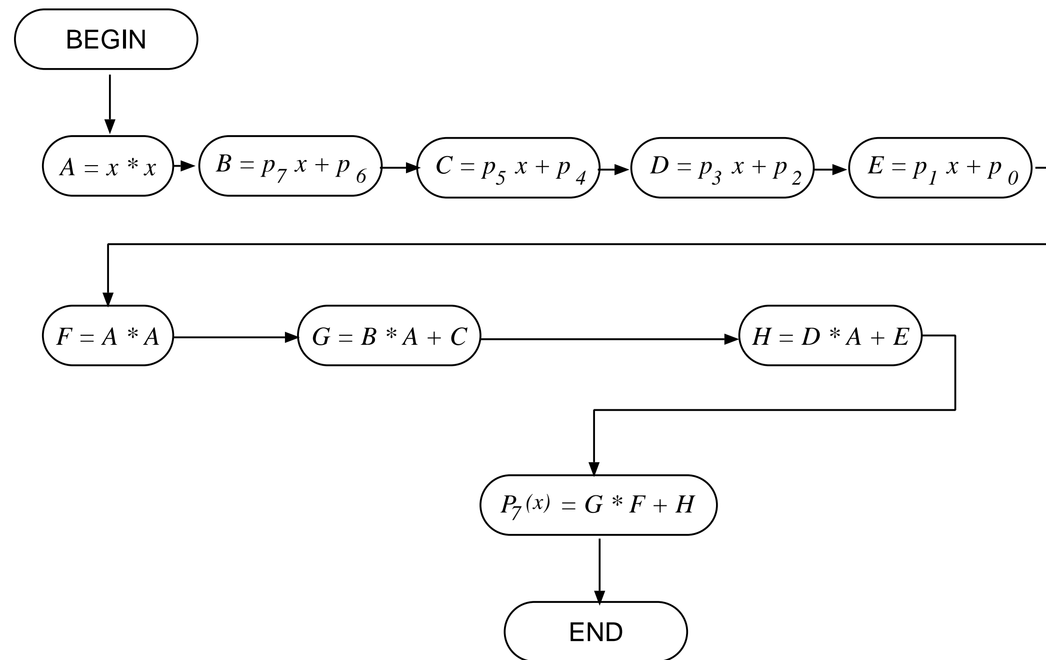

Figure 13.3: TRANSFORMATION OF A CONCURRENT EXECUTION GRAPH INTO A SEQUENTIAL ONE.

ORGANIZATION OF SYSTEMS

TWO FUNCTIONS:

- DATA TRANSFORMATIONS $\Longleftrightarrow$ FUNCTIONAL UNITS (operators)
- CONTROL OF DATA TRANSFORMATIONS
  AND THEIR SEQUENCING $\Longleftrightarrow$ CONTROL UNITS

TYPES OF SYSTEMS WITH RESPECT TO FUNCTIONAL UNITS:

- NONSHARING SYSTEM
- SHARING SYSTEM
- UNIMODULE SYSTEM

TYPES OF CONTROL

- CENTRALIZED CONTROL
- DECENTRALIZED CONTROL
- SEMICENTRALIZED CONTROL

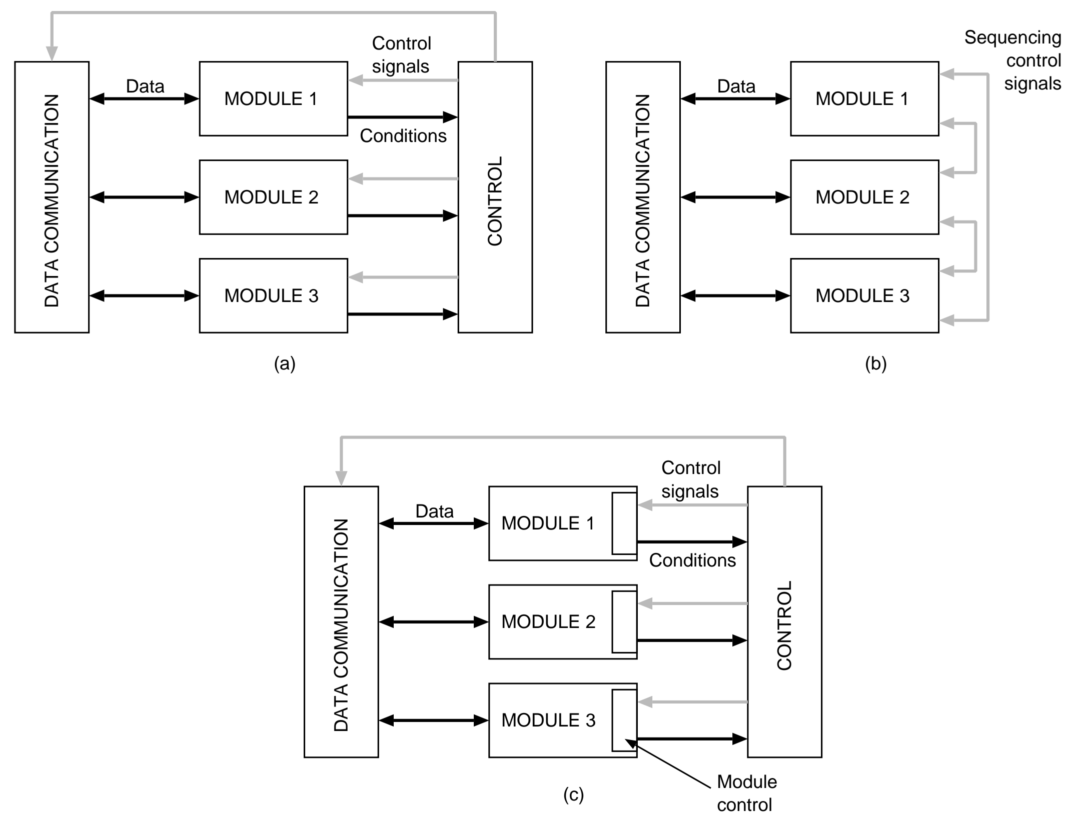

Figure 13.4: CONTROL STRUCTURES: a) CENTRALIZED; b) DECENTRALIZED; c) SEMICENTRALIZED.

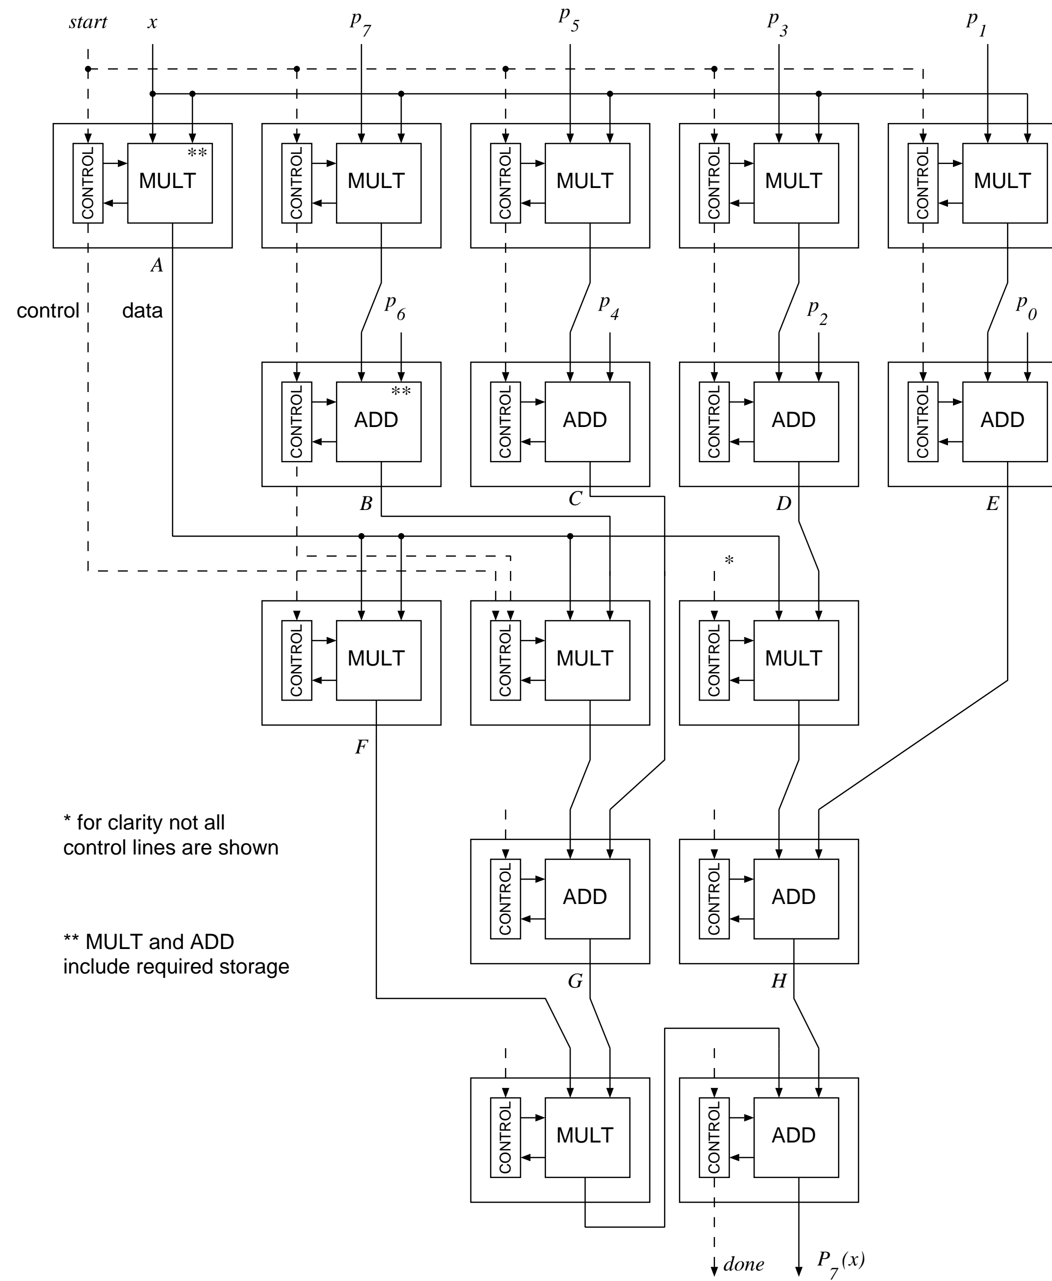

Figure 13.5: NON-SHARING DATA/DECENTRALIZED CONTROL IMPLEMENTATION FOR $P_7(x)$.

SHARING DATA SUBSYSTEM AND CENTRALIZED CONTROL

- MODULE OPERATIONS:

$$\begin{array}{llll} \textbf{if} & c1 = 1 & \textbf{then} & O_1 = I_{11} \times I_{12} + I_{13} \\ \textbf{if} & c2 = 1 & \textbf{then} & O_2 = I_{21} \times I_{22} + I_{23} \end{array}$$

I_{ij} corresponds to the i-th input of set j

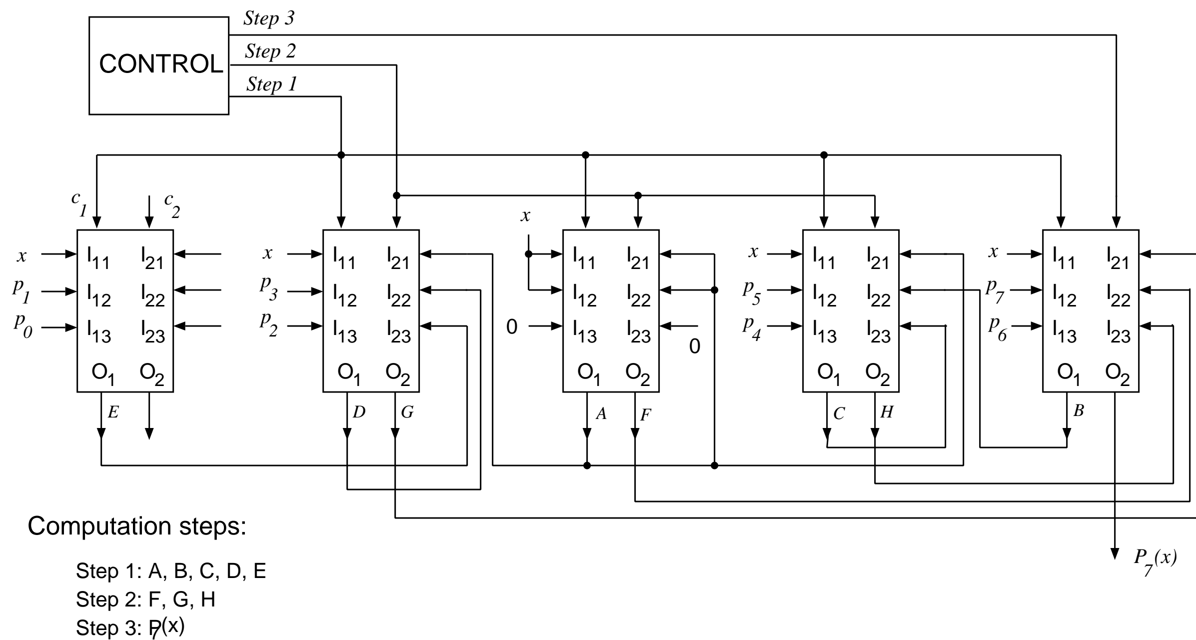

Figure 13.6: SHARING DATA SUBSYSTEM FOR $P_7(x)$.

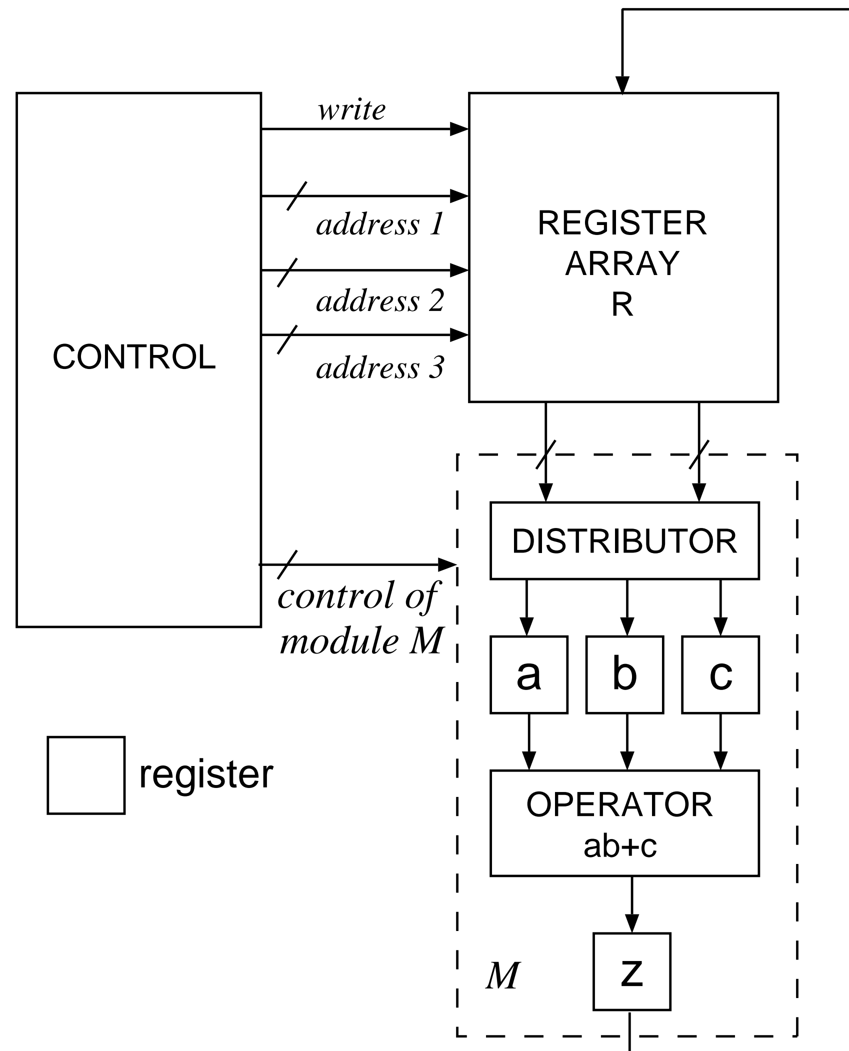

Figure 13.7: UNIMODULE DATA SUBSYSTEM FOR $P_7(x)$.

UNIMODULE DATA SUBSYSTEM

- A POSSIBLE MAPPING:

1: $a \leftarrow p_7,\ b \leftarrow x$
2: $c \leftarrow p_6$
3: $z \leftarrow p_7 x + p_6$
4: $T \leftarrow z$
5: $a \leftarrow T,\ c \leftarrow p_5$
6: $z \leftarrow T x + p_5$
and so on.

ORGANIZATION OF RTL SYSTEM

- DATA SUBSYSTEM: implements data storage, data movement and data transfers
- CONTROL SUBSYSTEM: controls the operations in the data subsystem and their sequencing

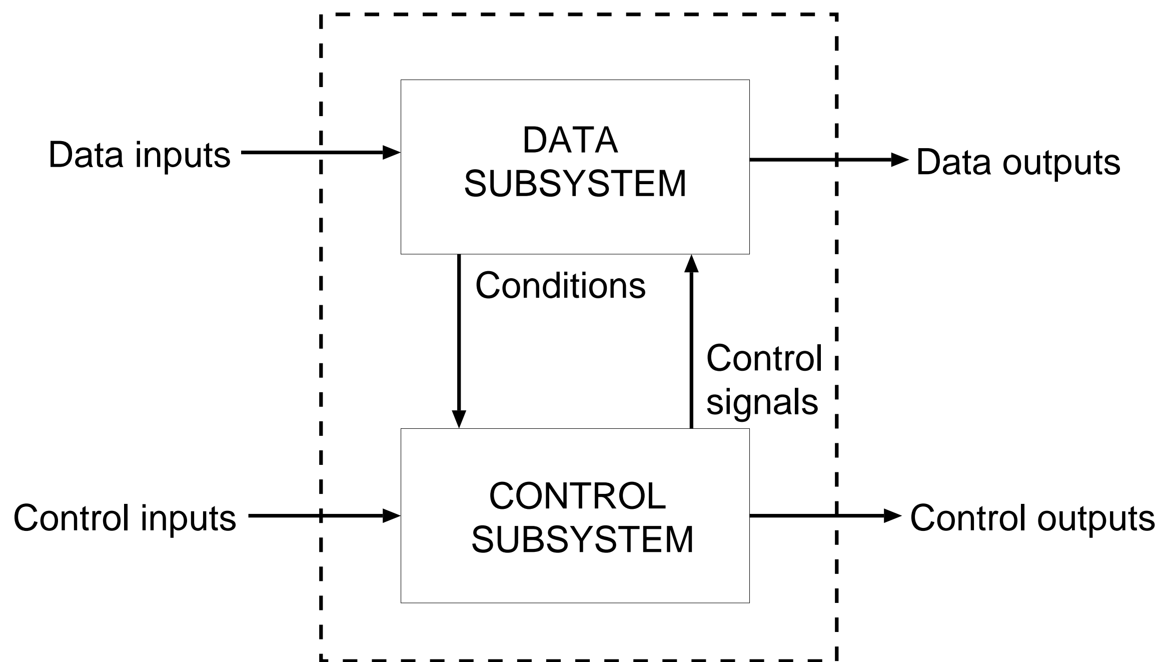

Figure 13.8: STRUCTURE OF A RTL SYSTEM.

Example 13.6

- A SYSTEM WHICH PERFORMS THE FOLLOWING COMPUTATION WITHOUT USING A TWO-OPERAND ADDER:

INPUTS: $x, y \in \{-128, \ldots, 127\}$
OUTPUT: $z \in \{-256, \ldots, 508\}$

FUNCTION: $z = \begin{cases} 4\lceil (x + |y|)/2 \rceil & \textbf{if} \quad x < |y| \\ 4x & \textbf{otherwise} \end{cases}$

- RTL SEQUENCE FOR THIS COMPUTATION IS BASED ON

$$a = (x + |y|)/2 = x + (|y| - x)/2$$

```
-- This is a high-level description; it is not intended
-- for synthesis. (The WHILE statement might not be
-- supported by a synthesis tool)

  PACKAGE inc_dec_pkg IS
    SUBTYPE SignDataT IS INTEGER RANGE -128 TO 127;
    SUBTYPE PosDataT  IS INTEGER RANGE    0 TO 128;
    SUBTYPE DataoutT  IS INTEGER RANGE -256 TO 508;
  END inc_dec_pkg;

  USE WORK.inc_dec_pkg.ALL;
  ENTITY inc_dec IS

```

(b)

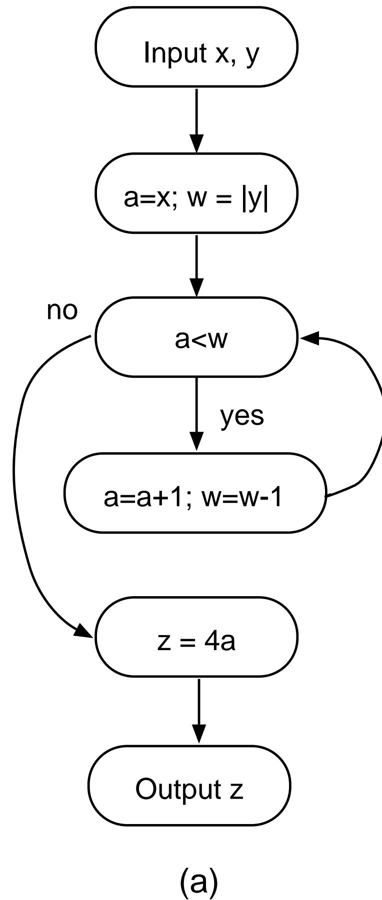

Figure 13.9: SYSTEM IN EXAMPLE 13.6: a) EXECUTION GRAPH; b) HIGH-LEVEL DESCRIPTION.

PROCEDURE TO OBTAIN SPECIFICATION

1. DRAW AN EXECUTION GRAPH FOR THE COMPUTATION

2. WRITE THE μVHDL DESCRIPTION OF THE SYSTEM, BASED ON THE EXECUTION GRAPH

Example 13.7

- NEWTON-RAPHSON RECURRENCE FOR COMPUTING APPROXIMATION z TO RECIPROCAL OF $1/2 \leq x < 1$

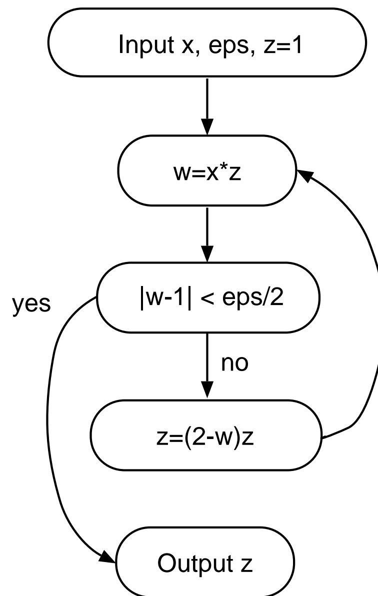
- RTL SEQUENCE DERIVED FROM

$$z_{i+1} = z_i(2 - xz_i), \quad z_0 = 1$$

- TERMINATES WHEN $x \times z_k - 1 < 0.5 \times \varepsilon$

- QUADRATIC CONVERGENCE

$$|xz_k - 1| = (xz_{k-1} - 1)^2$$



(a)

```

IF (ld_rec = '1') AND (selR = '1') AND (selM = '1') THEN
                                 rec <= MULTF(y,arg); END IF;
```

DESIGN OF RTL SYSTEMS

DESIGN OF DATA SUBSYSTEM:

1. DETERMINE THE OPERATORS (functional units)

   Two operations can be assigned to the same functional unit if they form part of different groups

2. DETERMINE THE REGISTERS REQUIRED TO STORE OPERANDS, RESULTS, AND INTERMEDIATE VARIABLES

   Two variables can be assigned to the same register if they are active in disjoint time intervals

3. CONNECT THE COMPONENTS BY DATAPATHS (wires and multiplexers) as required by the transfers in the sequence

4. DETERMINE THE CONTROL SIGNALS AND CONDITIONS required by the sequence

5. DESCRIBE THE STRUCTURE OF THE DATA SECTION by a logic diagram, a net list, or a μVHDL structural description

GENERALIZED BEHAVIORAL DESCRIPTION

```
ARCHITECTURE generalized OF
          data_subsystem IS
BEGIN
  PROCESS (clk)
    SIGNAL reg_A,reg_B: BIT_VECTOR;
  BEGIN
    IF (clk = '1') THEN
      IF (ctl0 = '1') THEN ... END IF;
      IF (ctl1 = '1') THEN ... END IF;
          .....
      IF (ctlj = '1') THEN ... END IF;
    END IF;
  END PROCESS;
END generalized;
```

(a)

```
ARCHITECTURE generalized OF
          control_subsystem IS
BEGIN
  PROCESS (clk)
    TYPE stateT is (s0, s1, sk);
    SIGNAL state: stateT:= s0;
  BEGIN
    IF (clk = '1') THEN
      CASE state IS
        WHEN s0 => ....;
        WHEN s1 => ....;
        WHEN sk => ....;
      END CASE;
    END IF;
  END PROCESS;
END generalized;
```

(b)

INTERFACE BETWEEN DATA AND CONTROL SUBSYSTEMS

```
ENTITY group_seq_system IS
  PORT    (data_in : IN  BIT_VECTOR; -- input data
           data_out: OUT BIT_VECTOR; -- output data
           ctrl_in : IN  BIT_VECTOR; -- input conditions
           ctrl_out: OUT BIT_VECTOR; -- output conditions
           clk     : IN  BIT      );
END group_seq_system;

ARCHITECTURE generalized OF group_seq_system IS
  SIGNAL controls : BIT_VECTOR; -- control signals
                                -- to data subsystem
  SIGNAL conds    : BIT_VECTOR; -- condition signals
                                -- from data subsystem
BEGIN
  U1: ENTITY data_subsystem
             PORT MAP (data_in,data_out,controls,conds,clk);
  U2: ENTITY control_subsystem
             PORT MAP (ctrl_in,ctrl_out,conds,controls,clk);
END generalized;
```

DESIGN OF CONTROL SUBSYSTEM

1. DETERMINE THE REGISTER-TRANSFER SEQUENCE
2. ASSIGN ONE STATE TO EACH `RT-group`
3. DETERMINE STATE-TRANSITION AND OUTPUT FUNCTIONS
4. IMPLEMENT THE CORRESPONDING SEQUENTIAL SYSTEM

DESIGN EXAMPLE: MULTIPLIER

INPUTS: $x, y \in \{0, 1, \ldots, 2^n - 1\}$
OUTPUT: $z \in \{0, 1, \ldots, 2^{2n} - 2^{n+1} + 1\}$
FUNCTION: $z = x \times y$

- RECURRENCE:

$$z[i+1] = \left(\frac{1}{2}\right)(z[i] + (x \times 2^n) \times y_i)$$

$z[0] = 0$ $z = z[n]$

OPERATIONS IN ONE ITERATION OF THE RECURRENCE:

- Multiplication of x by 2^n.
- Multiplication of $(x \times 2^n)$ by y_i, the i-th bit of $\underline{y}$ (value 0 or $x \times 2^n$)
- Addition of $z[i]$ and $(x \times 2^n) \times y_i$.
- Multiplication of the sum by $\frac{1}{2}$ (one-bit right shift)

EXECUTION GRAPH OF MULTiPlIER

IMPLEMENTATION - DATA SUBSYSTEM

- n-bit register x to store x and a $2n$-bit register z to store z
- n-bit register y to store y
- A module to generate $x \times 2^n$
- A module to generate $(x \times 2^n) \times y_i$
- A module to perform addition

$(x \times 2^8) \times y_i$	x x x x x x x x 0 0 0 0 0 0 0 0
$z[i]$	z z z z z z z z z z z z z z z z

- A module to perform multiplication by 1/2 and load the result in z

DATA SUBSYSTEM: CONTROL SIGNALS

`ldX,ldY,ldZ`	for loading `x,y,z`, respectively
`shY`	for right-shifting `y`
`clrZ`	for loading 0 into `z`

```

CYCLE TIME AND MULTIPLICATION TIME

- CYCLE TIME

  t_r : the delay of the registers to produce stable outputs. This includes the setup delay and the propagation delay.

  t_{buf} : the delay of the buffer required by the load on y_0.

  t_{and} : the delay of the AND gates.

  t_{add} : the delay of the adder.

- EXECUTION TIME: $n + 2$ cycles:
  one cycle in the idle state,
  one cycle in the setup state,
  n cycles for the iterations.
