# Highly integrated, re-configurable RF Receivers with an example of WCDMA, G/G/E receiver front-end without inter-stage SAW filter in 90nm CMOS

**Naveen Yanduru**
Texas Instruments Inc.

Outline

- The need for highly reconfigurable "multi-band, multi-mode" receiver.

- Multi-band receiver: Design directions and challenges.

- Multi-mode receiver: Architecture and design strategy for a re-configurable receiver.

- A WCDMA, GSM/EDGE "multi-mode" RF receiver front-end in 90nm CMOS.
- Conclusion.

Plethora of wireless applications for the mobile terminal

Voice, Data:

GSM/EDGE
WCDMA
WLAN
WiMAX

GPS

Bluetooth

DVB-H

Multiple bands across the frequency spectrum

GSM   E GSM   DCS   PCS   IMT2K   ISM

Multiple Standards

Signal Bandwidths
(narrow band, spread spectrum)

Multiple Bands

Modulation
(Amplitude with PAR, Phase only)

Highly Re-Configurable "Multi-Mode" Receiver

True Software Defined Radio Receiver
(Multi-Band, Multi-Mode)

Outline

- The need for highly reconfigurable "multi-band, multi-mode" SDR receiver.

- Multi-band receiver: Design directions and challenges.

- Multi-mode receiver: Architecture and design strategy for a re-configurable receiver.

- A WCDMA, GSM/EDGE "multi-mode" RF receiver front-end in 90nm CMOS.

- Conclusion.

Pre-Select Filter Bottleneck

➤ Pre-Select Filters (Duplexer/SAW/BAW) are band specific.
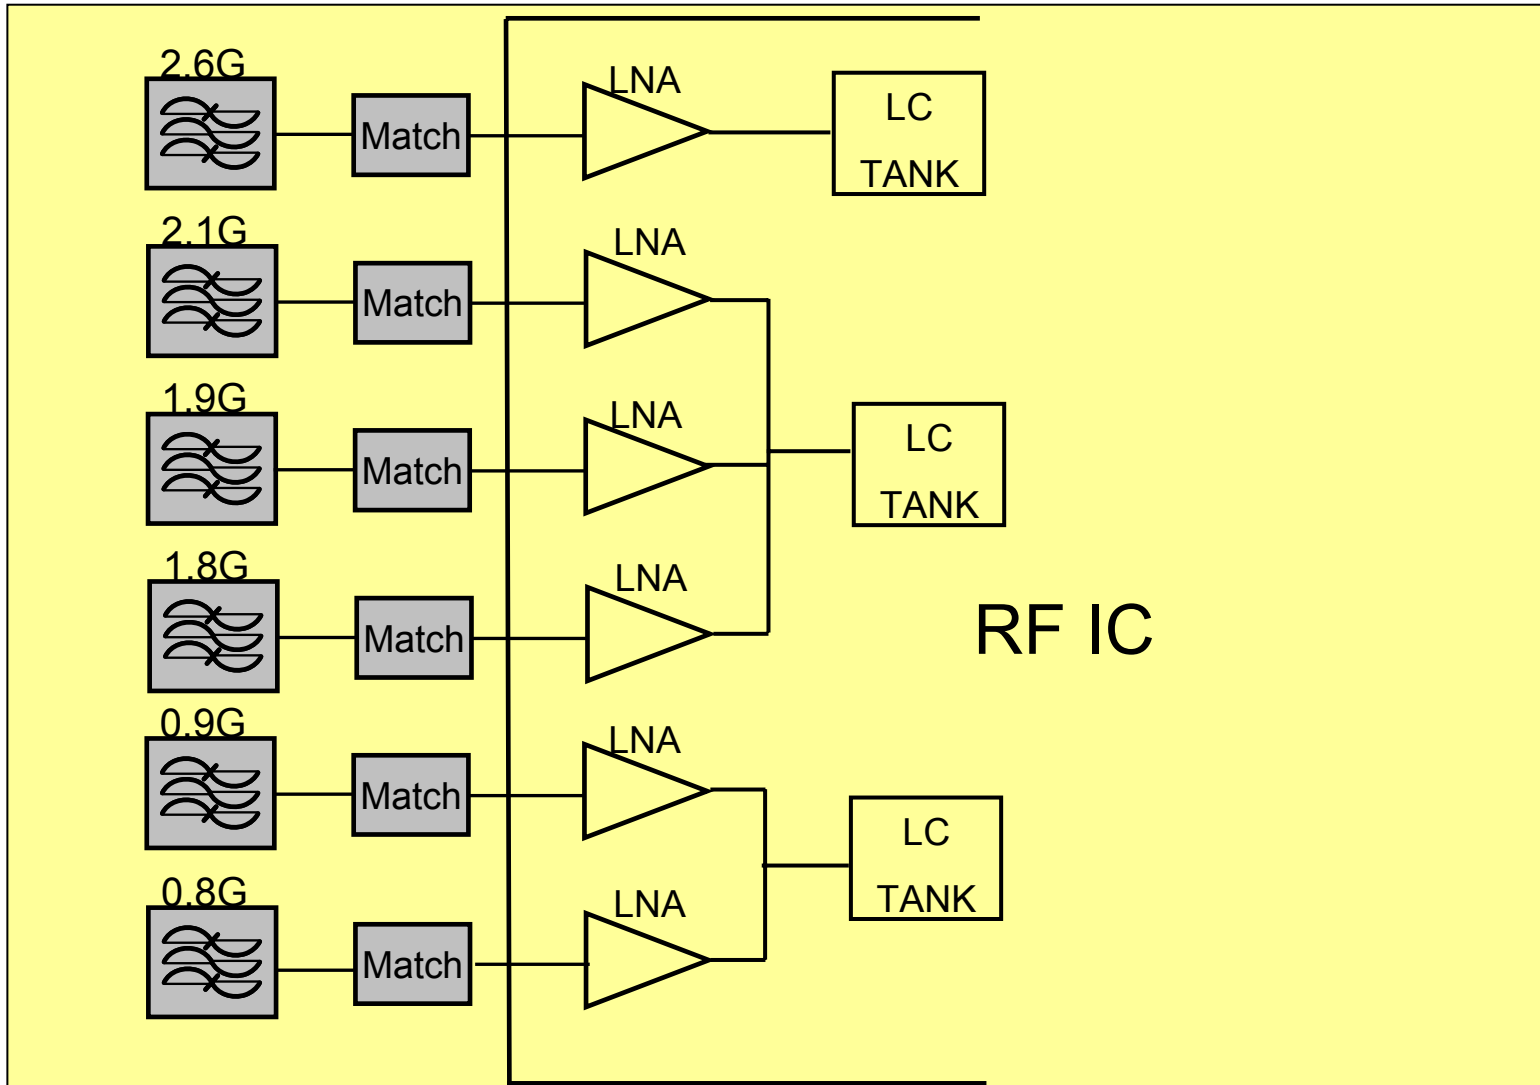

➤ **Dedicated RX input pins, Matching Networks, LNA input stages are required.**

6

Can we overcome this bottleneck?

High dynamic range RF ADC

- Nyquist rate as high as 10GHz.
- Dynamic range requirement of 100dB or more.

- Complete spectrum is converted to digital.
- A very powerful receiver!

- State of the art ADCs are not able to meet this required performance.

Integrated Tunable RF Bandpass Filters
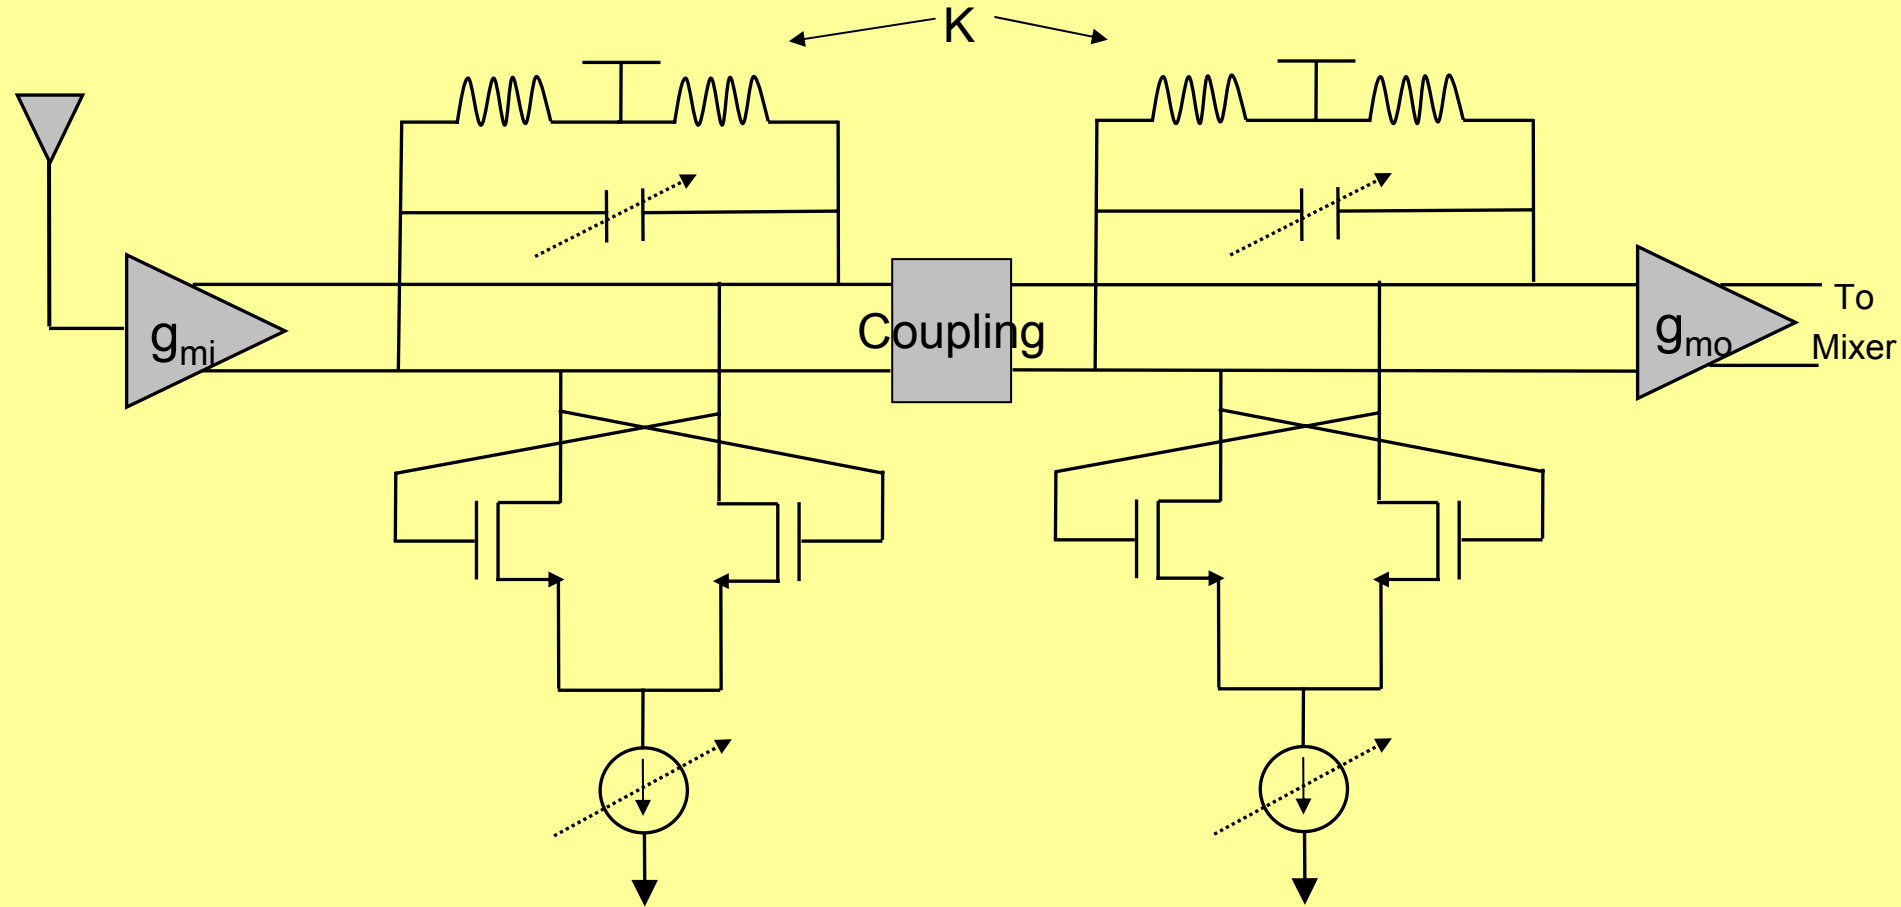

- ➤ Dynamic range issues based on low Q of on-chip inductors.
- ➤ Issues with channel based tuning and tuning range.
- ➤ Input g_m linearity is still an issue.

[Ref] Kuhn, W.B.; Yanduru, N.K.; Wyszynski, A.S., "Q-enhanced LC bandpass filters for integrated wireless applications", IEEE-MTT Dec. 1998.

RF filtering using MEMS

- MEMS based RF filters using switchable capacitors for tuning have been shown.

- Low loss switches can be used to switch between various RF filters.

Broad-band LNA

Low loss Switch

RF MEMS tunable filters
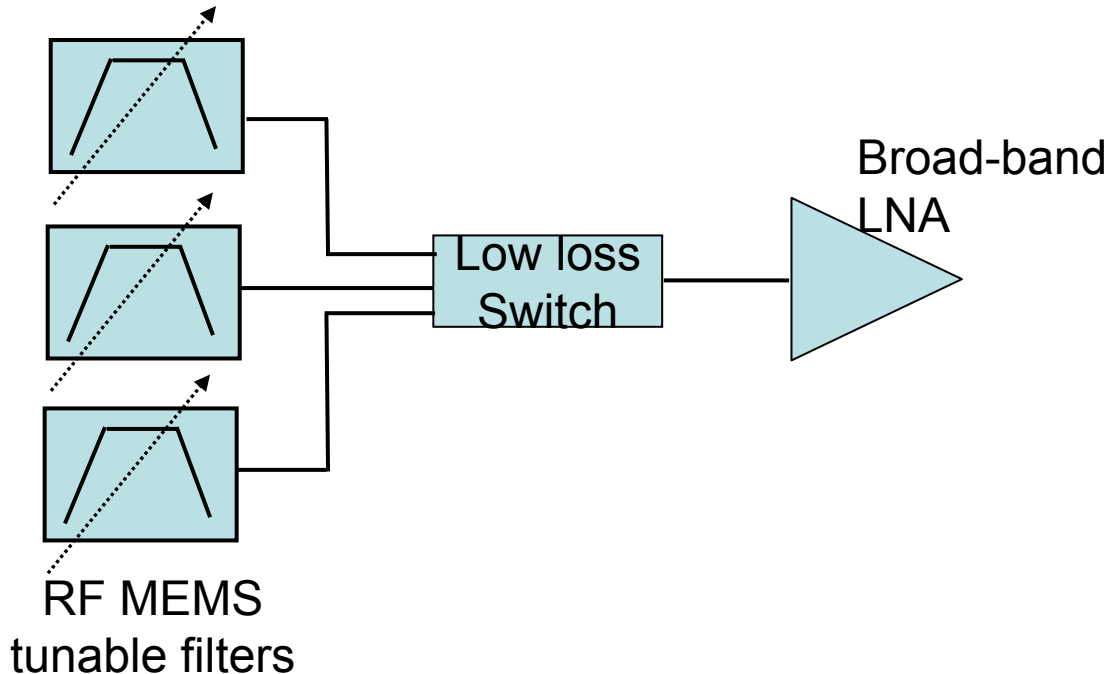

- Issues with MEMS such as reliability, yield and complexities in integrating mechanical structures with transistors need to be considered.

- The loss in the switch will degrade sensitivity.

[Ref] Nguyen C. T –C, "RF MEMS in wireless Architectures", DAC 2005.

[Ref] S.-J Park, K.-Y Lee, G.M. Rebeiz, "Low-Loss 5.15 to 5.70-GHz RF MEMS Switchable Filter for Wireless LAN Applications" IEEE-MTT, Nov. 2006.

Clock driven discrete time analog filtering with anti-alias notches followed by ADC

Wideband LNA

I

Q

➢ **Input linearity of the LNA and Mixer in the absence of any RF filtering needs to be addressed.**

[Ref] Abidi, A. A., "Evolution of a Software-Defined Radio Receiver's RF Front End," IEEE *RFIC Symposium 2006.*

[Ref] Muhammad, K., et al, "The First Fully Integrated Quad-Band GSM/GPRS Receiver in a 90-nm Digital CMOS Process" IEEE JSSC, Aug. 2006.

Discrete time analog filtering (cont.)

Switched Capacitor filter
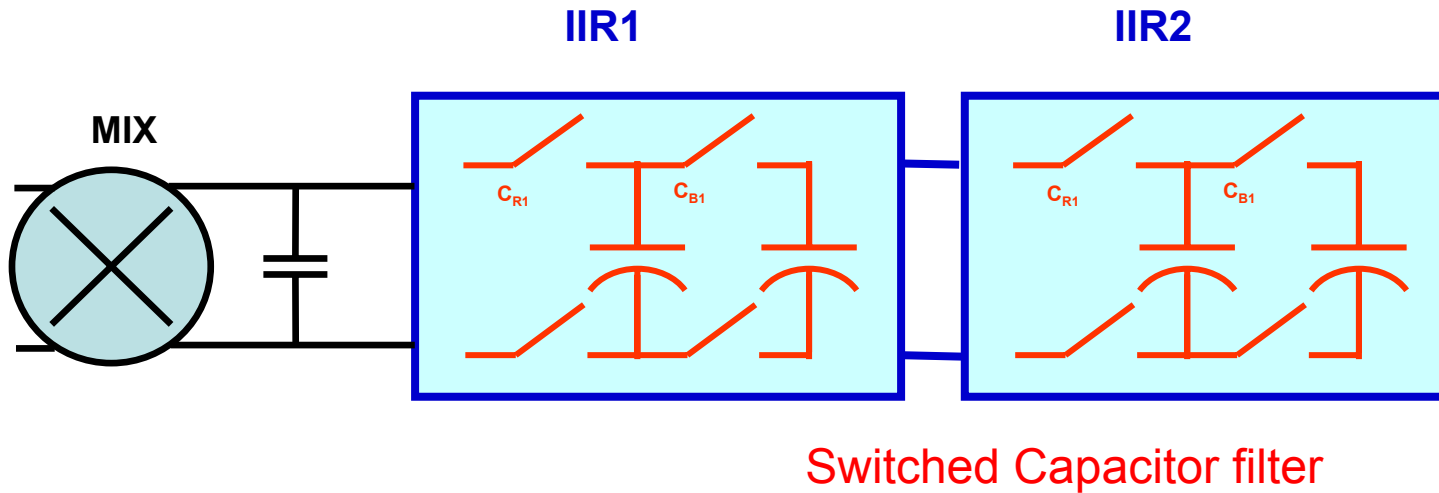

- ## Advantages
  - Digital process friendly base-band filtering.
  - Easy programmability of base-band filtering between modes and for notches.

- ## Disadvantages
  - **Main issue of linearity of LNA, mixer needs to be addressed.**

Blocker cancellation RF Front Ends
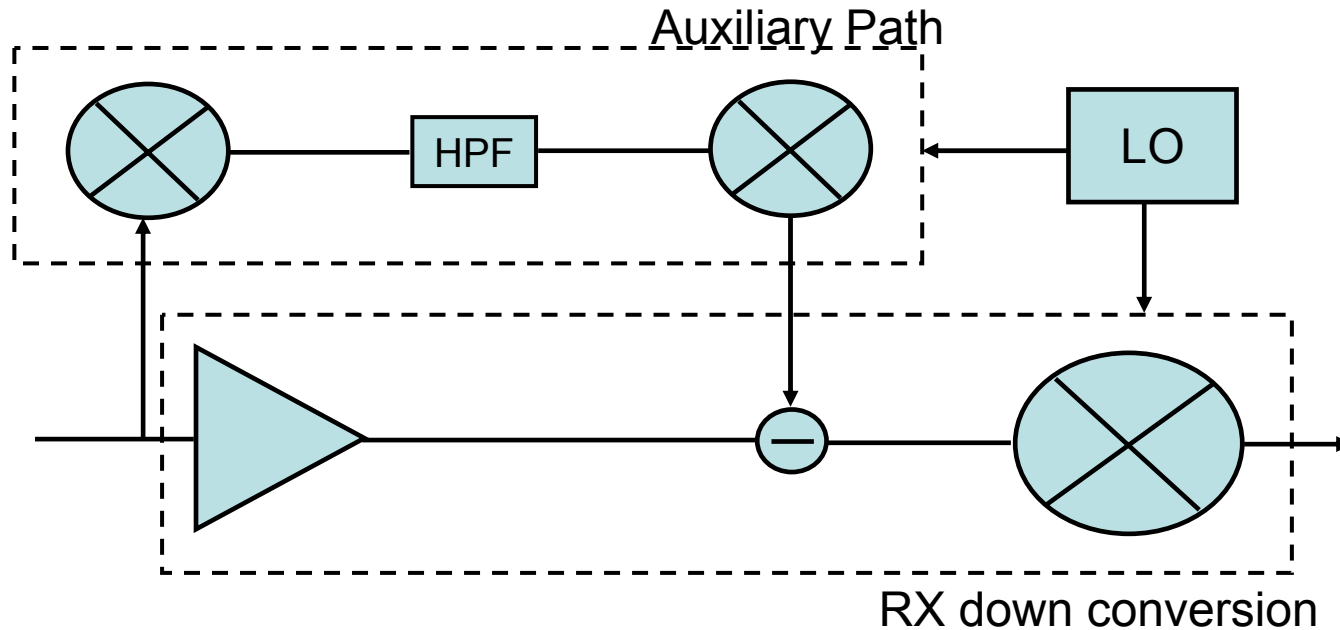

A feed-forward blocker cancellation technique

- Advantages
  - Removes in-band and out-of-band blockers.
  - Relaxes linearity for the Mixer.
- Disadvantages
  - Mismatch issues with gain and phase inversion between the main and aux. path.
  - LNA linearity still a challenge,
  - Phase noise requirement is shifted to up-conversion mixer of Aux. path.

[Ref] R. Gharpurey, S. Ayazian, "Feedforward Interference Cancellation in Narrow-Band Receivers" 2006 IEEE Dallas/CAS Workshop, Oct. 2006.

[Ref] H. Darabi, "A Blocker Filtering Technique for Wireless Receivers", ISSCC 2007.

Some other approaches including blocker detection using fast RSSI and subsequent reduction in RF gain have been investigated.

But these schemes along with other schemes discussed are not able to match the RF performance of a receiver with pre-select filter.

Outline

- The need for highly reconfigurable "multi-band, multi-mode" SDR receiver.

- Multi-band receiver: Design directions and challenges.

- Multi-mode receiver: Architecture and design strategy for a re-configurable receiver.

- A WCDMA, GSM/EDGE "multi-mode" RF receiver front-end in 90nm CMOS.

- Conclusion.

Direct Conversion as Receiver Architecture

Advantages:

➢ Reduced hardware (Image rejection/filtering, Signal processing, Synthesizer)

Issues:

➢ Second order inter-modulation/"self-mixing" issues with modulated blockers.

➢ Flicker noise.

➢ LO leakage and dc offsets.

A "Near-Zero or Low-IF" architecture can be used if image rejection requirements are not too difficult.

# 2nd order inter-modulation distortion in direct conversion receiver

Figure showing IM2 distortion from modulated TX blocker in FDD mode.

Any modulated blocker with non-constant envelope (AM) causes this distortion.

[Ref] Khan, M.S.; Yanduru, N., "Analysis and Measurement of Self Mixing of Transmitter Leakage in WCDMA Receivers," *RAWCON 2007*.

Distortion in the presence of LO leakage in Direct Conversion Receivers (1)

$\omega_1-\omega_2$, $\omega_2-\omega_1$ at the output of the mixer looks like an IM2 component. (Can misleadingly imply an IP2 issue!)

But really it is the LO leakage and IP3 that is the problem!

[Ref] Manstretta, D. et. al. "Second-order intermodulation mechanisms in CMOS down converters", JSSC March 2003 Page(s):394 – 406.
[Ref] Elahi, I. et. al. "IIP2 and DC Offsets in the Presence of Leakage at LO Frequency", TCASII Aug. 2006.

Distortion in the presence of LO leakage in Direct Conversion Receivers (2)

Distortion caused by an AM blocker will have similar issue like the two tone case shown earlier.

Performance re-configurability in RF front end

- A high dynamic range RF Front End design without any inter-stage external filter is the starting point.

- Need to be able to program this front end for various combinations of noise/linearity/power.

- Need to have little degradation in overall performance between various programming modes.

## Linearity/(Noise*Power) ~ Constant

- High Linearity mode – FDD mode, higher input signal conditions.

- Low Noise mode – TDD mode, sensitivity conditions.

- Low Power mode – high input signal, low level of blockers.

Outline

- The need for highly reconfigurable "multi-band, multi-mode" SDR receiver.

- Multi-band receiver: Design directions and challenges.

- Multi-mode receiver: Architecture and design strategy for a re-configurable receiver.

- A WCDMA, GSM/EDGE "multi-mode" RF receiver front-end in 90nm CMOS.

- Conclusion.

A WCDMA, GSM/GPRS/EDGE "multi-mode" RF Receiver Front End in 90nm CMOS without inter-stage SAW filter

# A tri-band WCDMA receiver *with* inter-stage SAWs
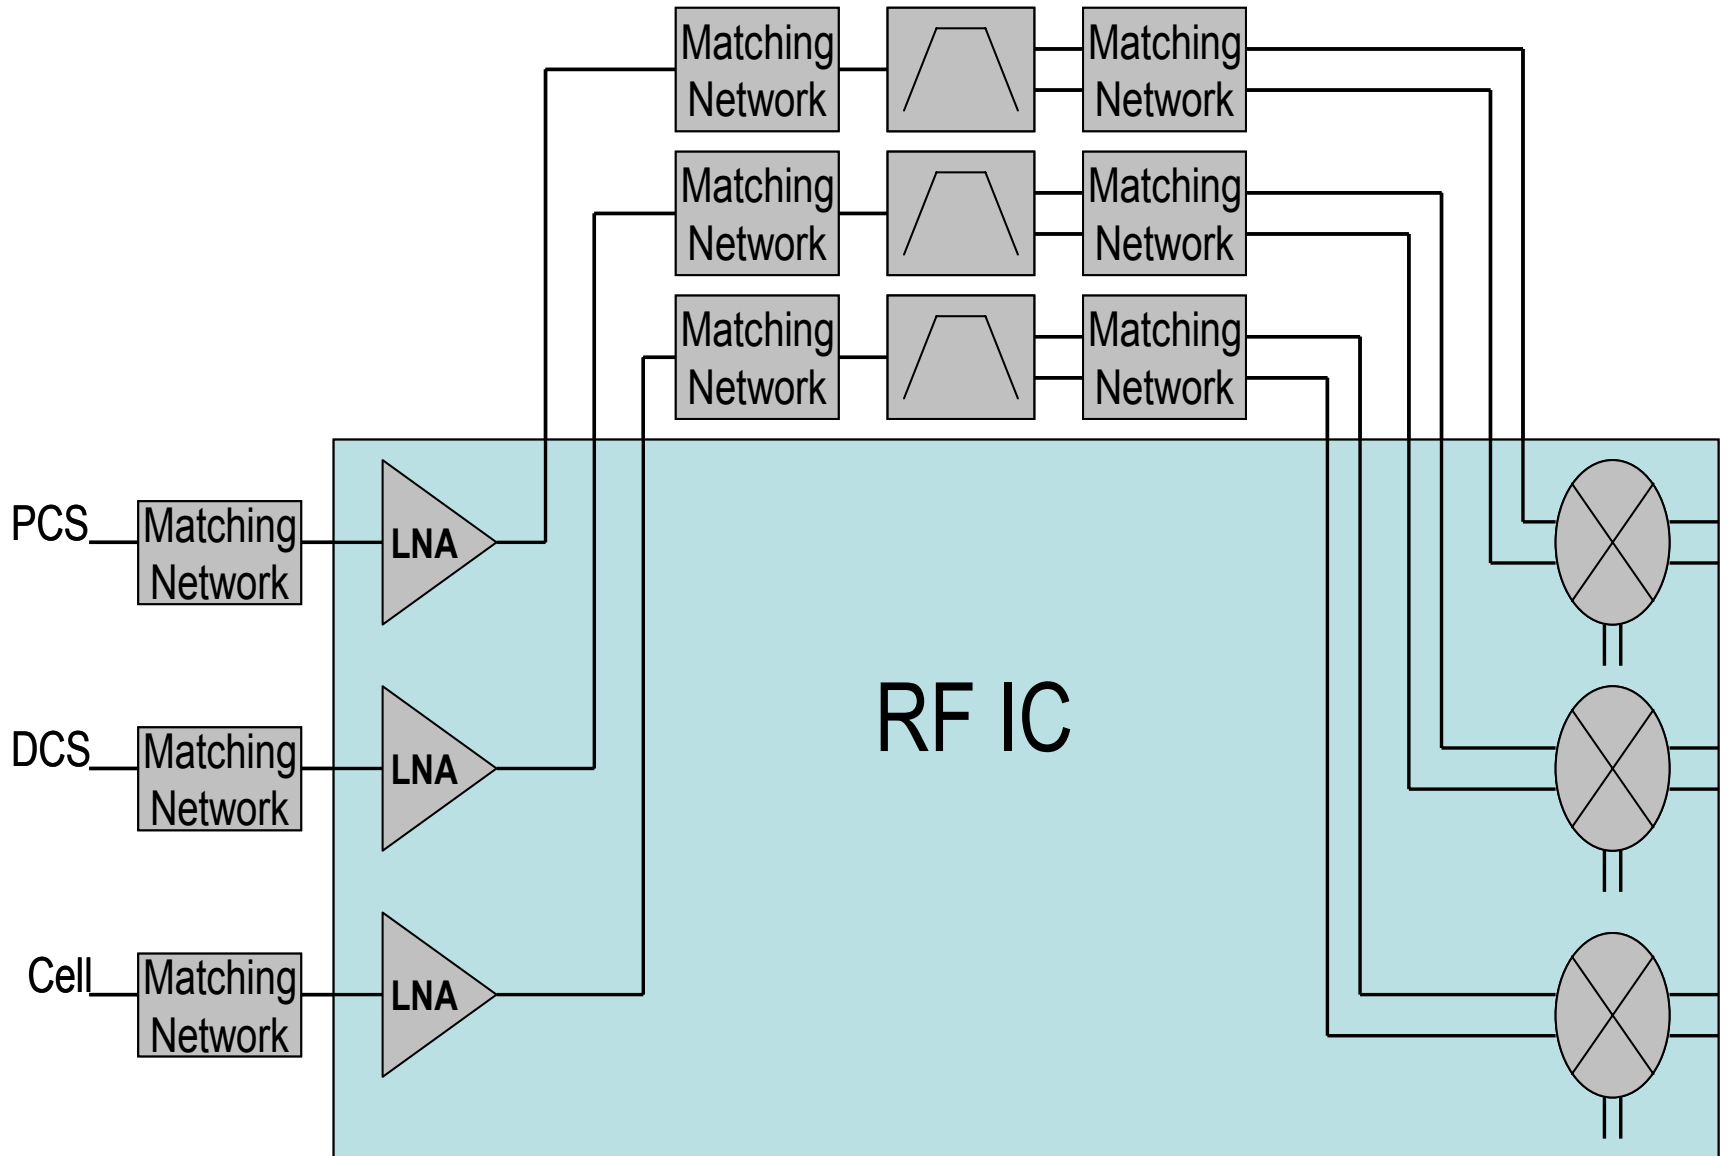

A tri-band WCDMA receiver *without* inter-stage SAWs
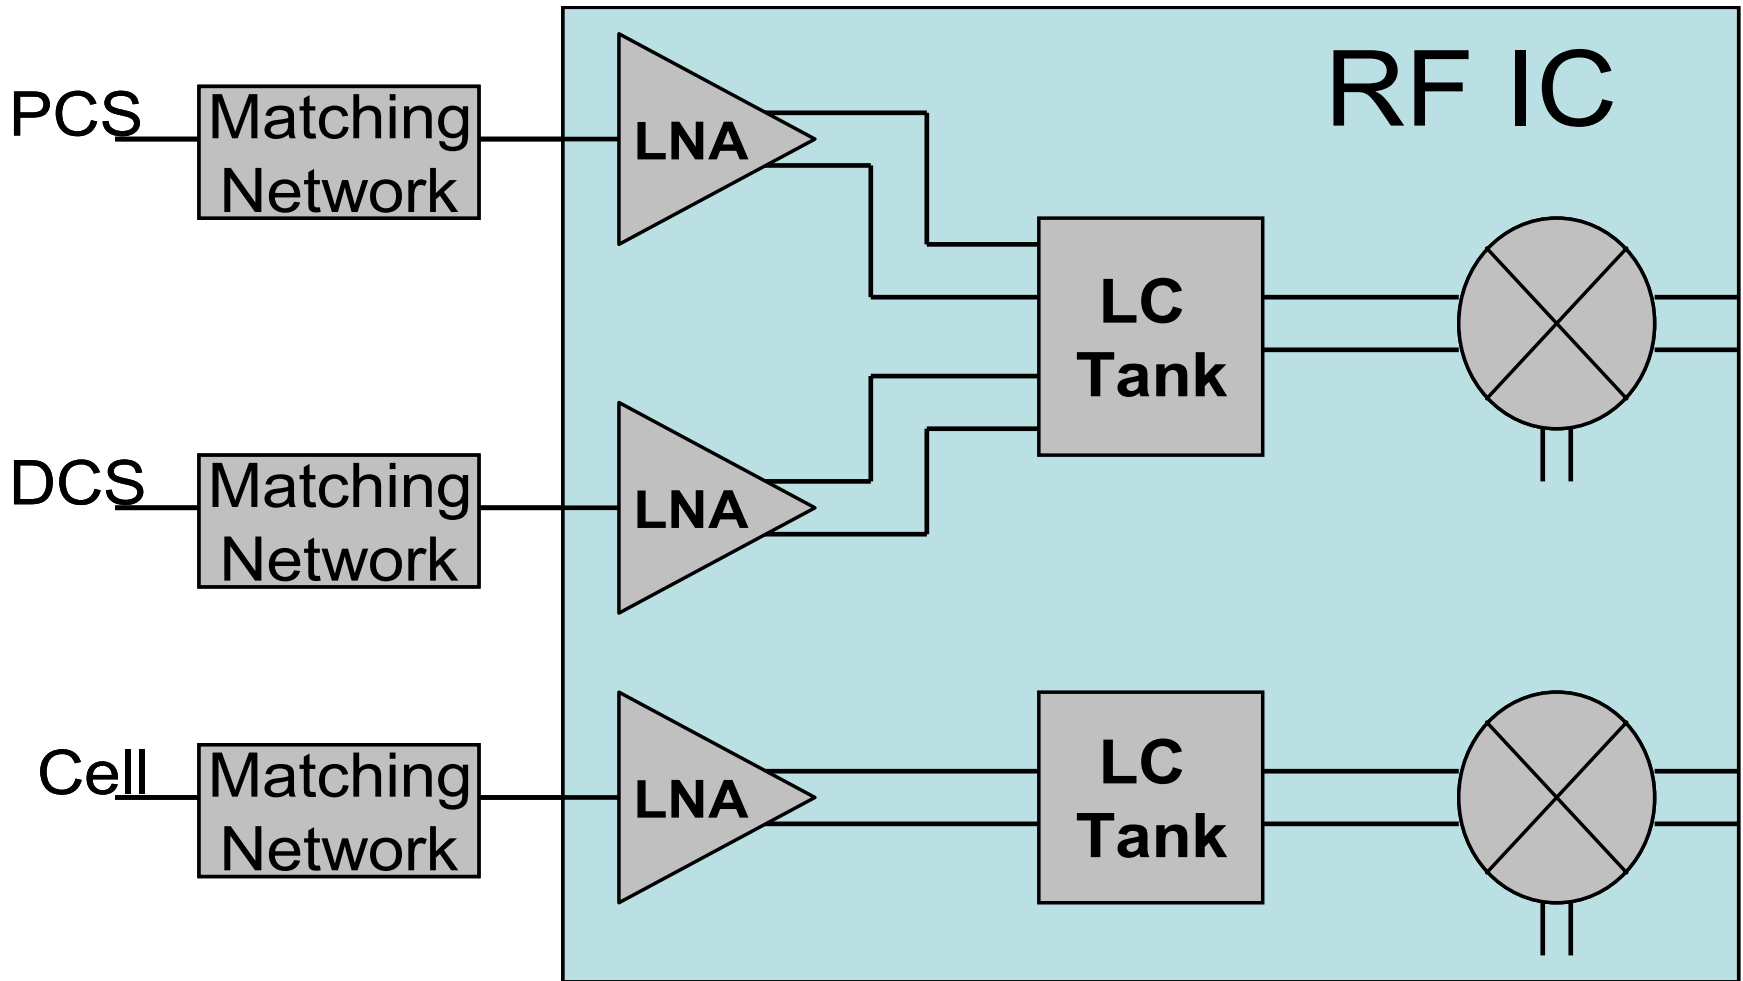

Advantages of SAW removal in a tri band WCDMA receiver

- Integration
  - Saves 3 SAW filters
  - 15 matching components
  - 9 pins on the IC
  - Board area

- More suitable for RX path to be configured as dual mode (WCDMA/GGE)

Linearity bottleneck in WCDMA receiver
## - IIP2 based on TX leakage
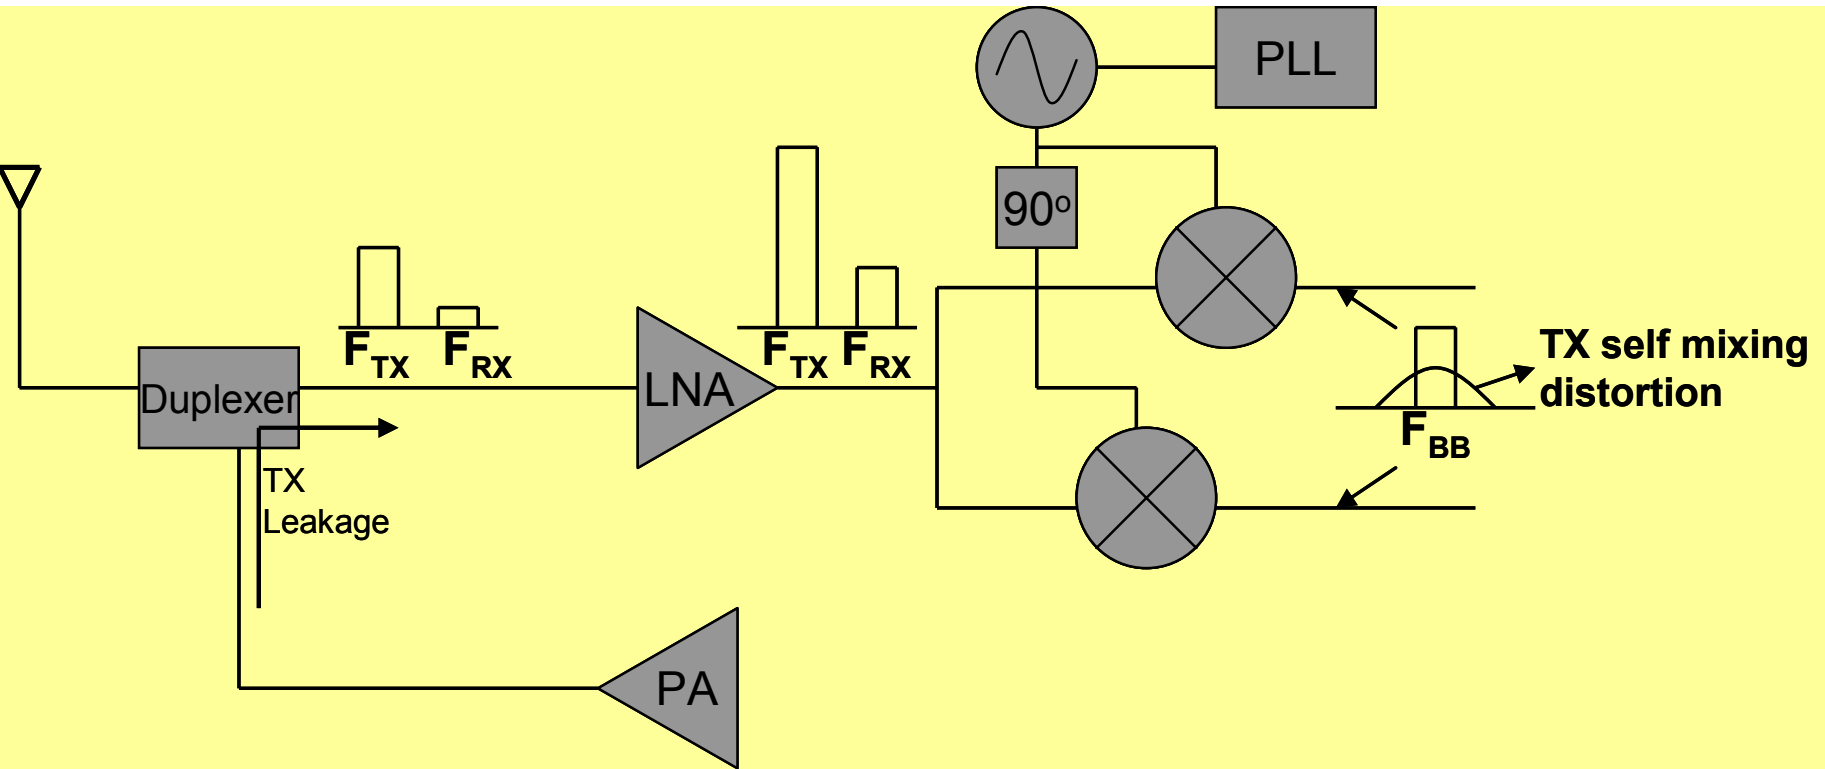

Input IP2 = $2P_{TX} - P_{IM2} -$ "Adj_N"

Where,

P_{IM2} is the input referred IM product;

"Adj_N" is the adjustment factor which depends on no. of channels in the TX leakage

[Ref] Khan, M.S.; Yanduru, N., "Analysis and Measurement of Self Mixing of Transmitter Leakage in WCDMA Receivers," *IEEE-RWS 2007.*

Linearity bottleneck in WCDMA receiver
- IIP3 from TX leakage, blocker

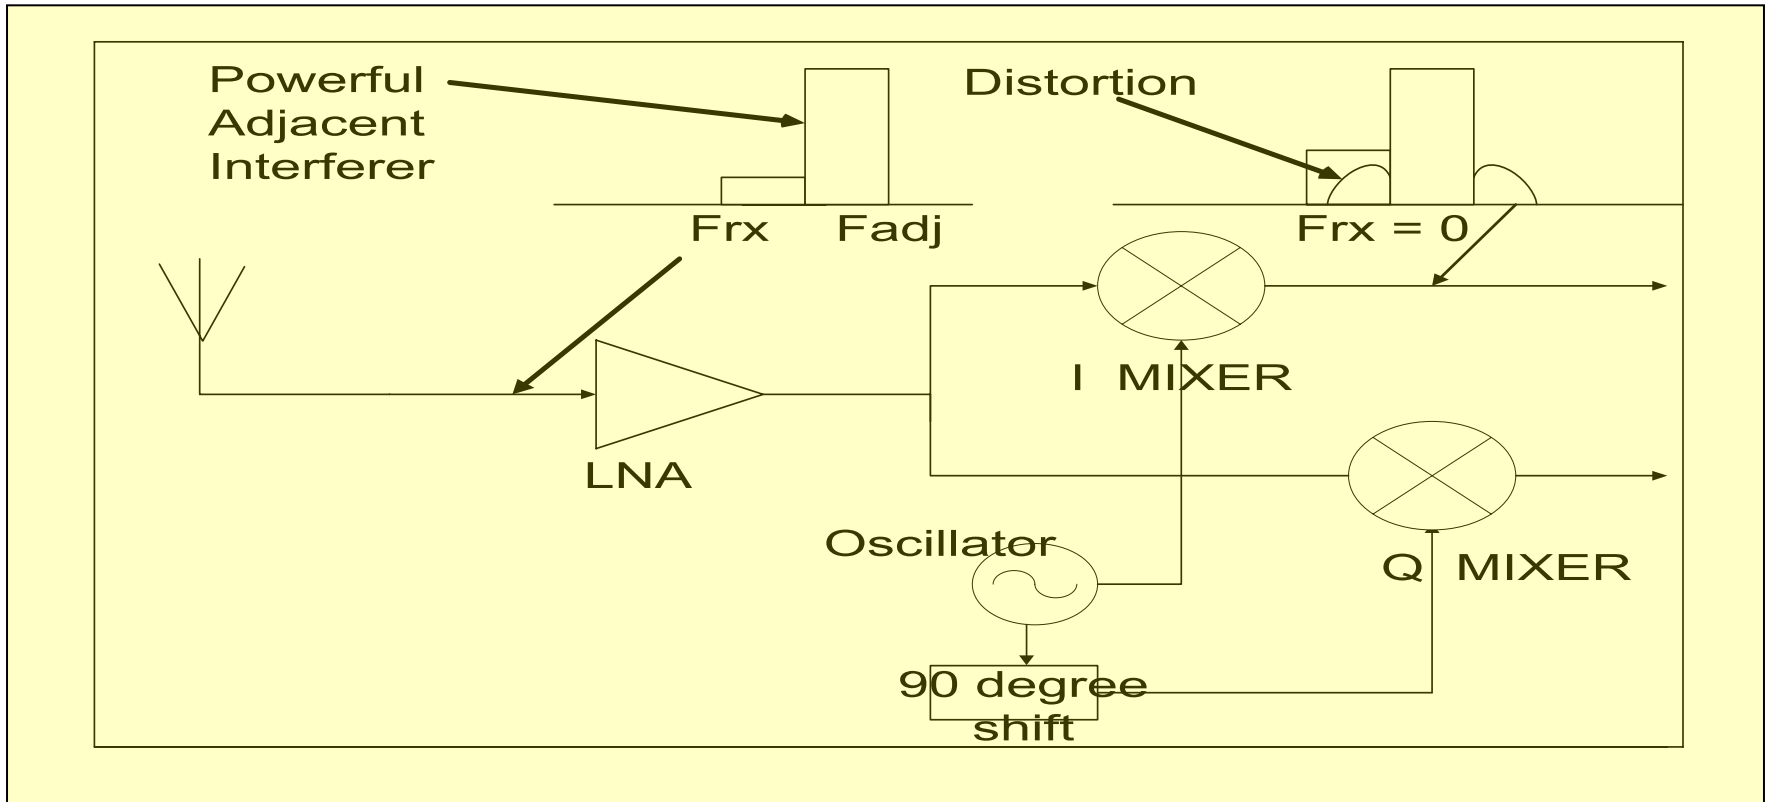

Input IP3 = $(2P_{BLK} + P_{TX} - P_{IM3} + \text{"Adj\_N"}) / 2$

Where,

P_{IM3} is the input referred IM product;

"Adj_N" is the adjustment factor which depends on no. of channels in the AM blocker.

[Ref] Khan, M.S.; Yanduru, N., "Analysis of Signal Distortion due to Third Order Non-Linearity in WCDMA Receivers," *IEEE ISCAS 2006.*

Spectral re-growth of WCDMA adjacent channel

Input IP3 = $(3P_{ADJ} - P_{IM} + \text{"Adj\_N"}) / 2$

Where,

P_{IM} is the input referred Spectral re-growth product;
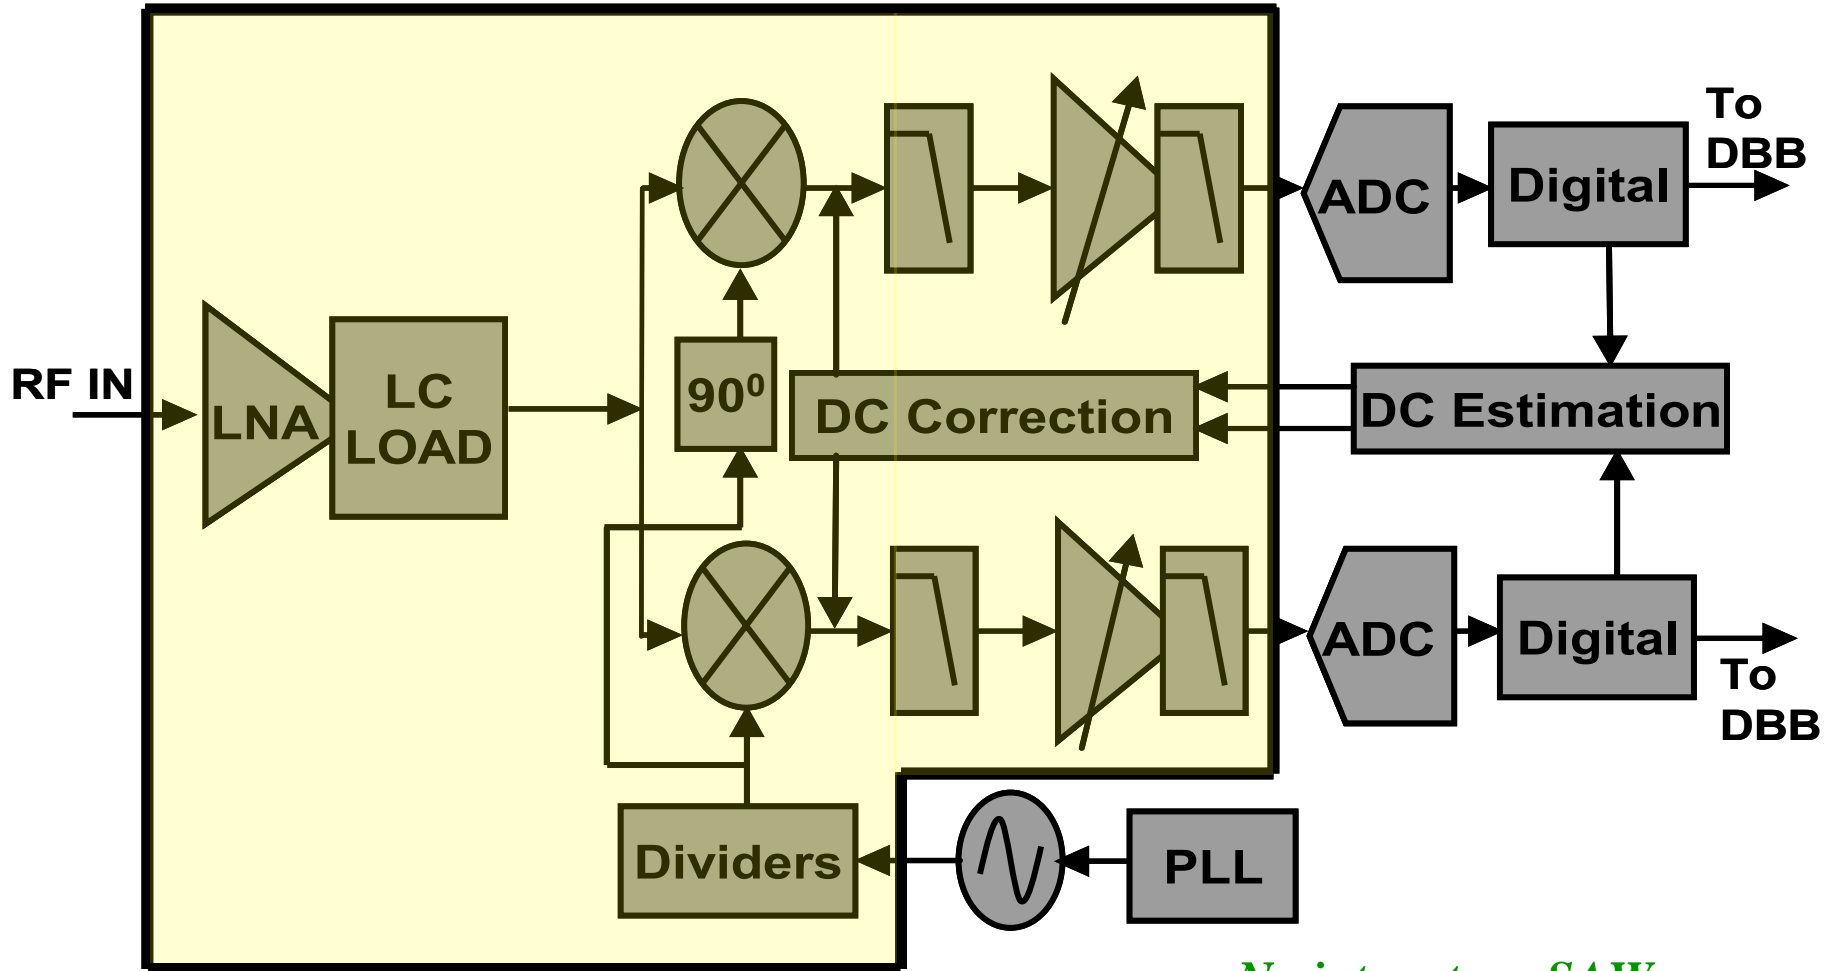

"Adj_N" is the adjustment factor which depends on no. of channels in the AM blocker.

Khan, M.S.; Yanduru, N., "Signal Distortion Due To Spectral Re-Growth of Adjacent Channel Interferers in WCDMA Receivers," *IEEE-RWS 2007.*

Key RF Performance Specifications

RF Parameter	GGE Mode (GSM/GPRS/EDGE)	WCDMA Mode	Units
NF	2.5	3.0	dB
IIP3	-18	-7	dBm
IIP2	40	44	dBm
Signal Bandwidth	0.2	3.84	MHz

- Higher LNA gain in GSM mode
- Adjust base band filter corner based on signal bandwidth
- Trade IP3 with current in GSM mode.

30

Pros & Cons

- Pros
  - + Design in 90nm CMOS
  - + Highly integrated receiver
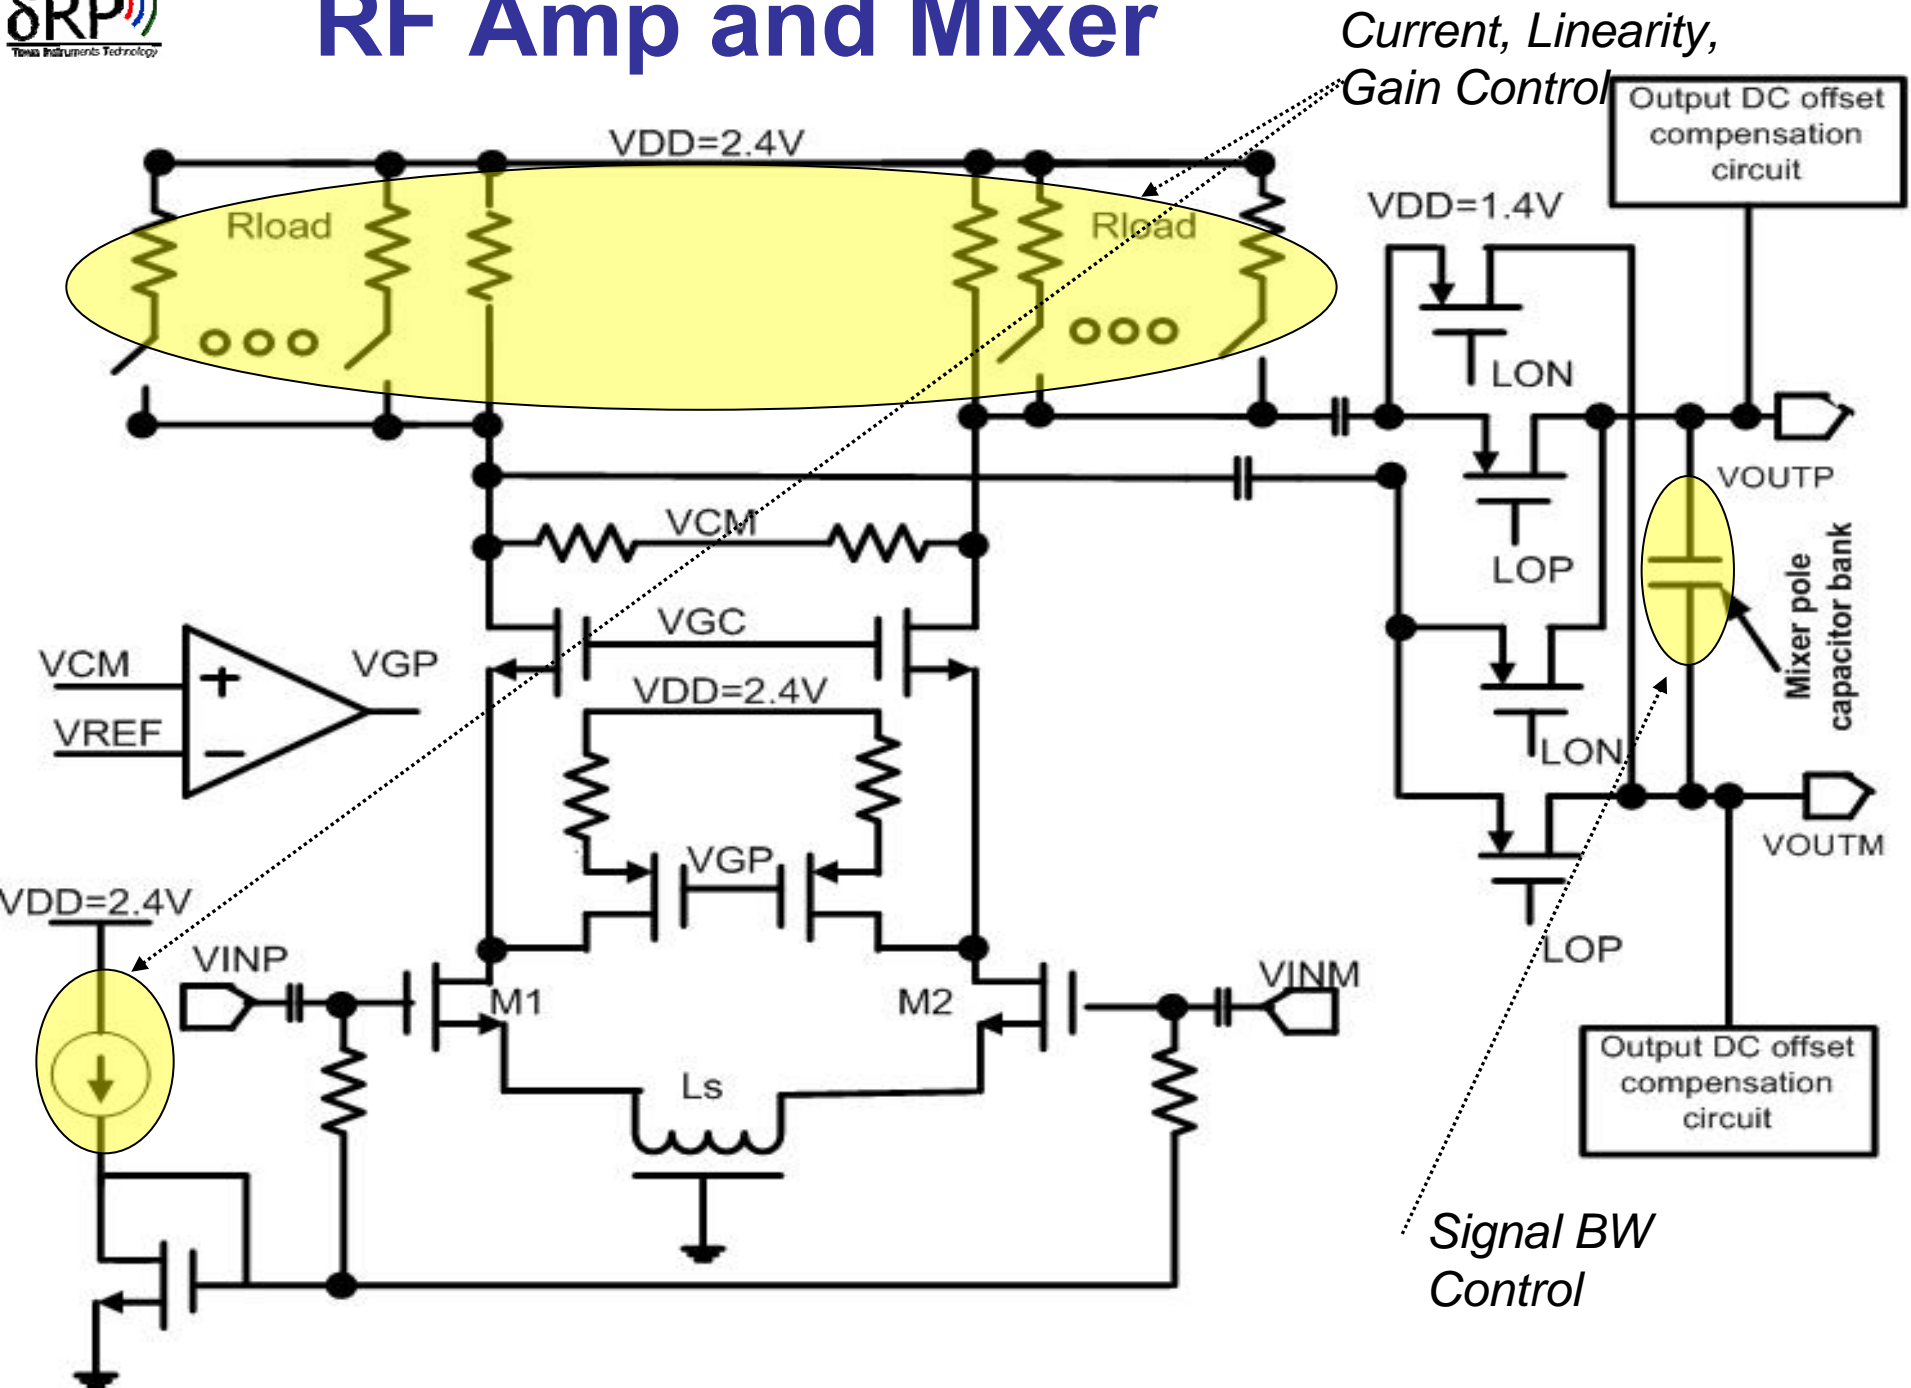

- Cons
  - – Uses 2.4V supply for the mixer (rest of the chip uses 1.4V)
 - – Use of bond-wire inductor for the tuned LC LNA load

WCDMA measured performance - Band III

| Parameter	Measured performance
Voltage gain	37.3 dB
NF	2.90 dB
In band IIP3	-10.8 dBm
Out of band IIP3 (CW blockers at TX and TX+47.5MHz)	-7.3 dBm
Out of band IIP3 (CW blockers at TX and TX-95MHz)	-3.75 dBm
Out of band IIP2 (2 CW blockers at TX freq.)	47.0 dBm

GGE measured performance – DCS band

Parameter	Measured performance
Voltage gain	37.3 dB
NF	2.90 dB
NF under blocking (3MHz blocker at -23dBm), includes reciprocal mixing	8.64dB
IIP3 (blockers at 800kHz and 1600kHz offset)	-10.8 dBm
IIP2 (self-mixing of blockers at 6MHz offset)	44.0 dBm

More Measured performance

Parameter	Measured performance
S11	-14 dB
Output DC offset (after correction)	50 uV
Gain imbalance (WCDMA)	0.4 dB
Gain Imbalance (GGE)	0.3 dB
Phase imbalance (WCDMA)	4°
Phase Imbalance (GGE)	1°
Out of Band IIP2 (WCDMA) (CW blockers at RX+TX and TX)	34.7 dBm

# VGA voltage gain curve

Voltage Gain vs VGA Gain Setting
NF vs. VGA Gain Setting

# Measured spectral re-growth based on number of channels in adjacent channel

Re-growth of a 1 DPCH WCDMA ACI

Re-growth of a 16 DPCH WCDMA ACI

➢ High PAR/increase in channels in adjacent channel will cause increased spectral re-growth.

Die Photo

Outline

- The need for highly reconfigurable "multi-band, multi-mode" SDR receiver.

- Multi-band receiver: Design directions and challenges.

- Multi-mode receiver: Architecture and design strategy for a re-configurable receiver.

- A WCDMA, GSM/EDGE "multi-mode" RF receiver front-end in 90nm CMOS.

- Conclusion.

Conclusion

- The need for "multi-band, multi-mode" receivers to support SDR is highlighted.

- Multi-band receiver: Various approaches and directions in trying to achieve this goal are presented.

- Multi-mode receiver:
  - A multi-mode receiver front end in 90nm CMOS is presented.
  - The high performance achieved eliminates the need for inter-stage SAW filter.

- Once a clear winner showing the performance and requirements for multi-band receiver emerges, we will have the RF receiver for SDR.
