# ROHS Reliability Impact

- RoHS Directive 2002/95/EC
  - WEEE Directive 2002/96/EC
- Failure Mechanisms
  - Tin Whiskers
    - Mechanisms
  - Solder Joint Failures
  - Mitigation Strategies
- Tensile Strength
- Solderability
  - Testing
  - Shelf Life
  - Plating Considerations

# ROHS Reliability Impact

- **RoHS Directive 2002/95/EC**
  - WEEE Directive 2002/96/EC
- Failure Mechanisms
  - Tin Whiskers
    - Mechanisms
  - Solder Joint Failures
  - Mitigation Strategies
- Tensile Strength
- Solderability
  - Testing
  - Shelf Life
  - Plating Considerations

# RoHS Directive

- This Directive takes effect on **July 1, 2006**, and with some exceptions (Annex) totally bans the use of (Article 4.1):
  - lead,
  - mercury,
  - cadmium,
  - hexavalent chromium,
  - polybrominated biphenyls (PBB's),
  - polybrominated diphenyl ethers (PBDE's),
  - in electronic and electrical products and equipment

# RoHS Directive

- Council Decision COM(2004) 606, adopted Sept. 23, 2004), amends the Annex of the RoHS Directive to permit-- in any application that was not already exempted--a homogenous material to contain a maximum of:
  - 0.1% lead by weight.
  - 0.1% mercury by weight.
  - 0.01% cadmium by weight.
  - 0.1% hexavalent chromium by weight.
  - 0.1% polybrominated biphenyls by weight.
  - 0.1% polybrominated diphenyl ethers by weight.

# RoHS Directive

## WEEE Directive Influence

- Makes the producer (the company whose brand is on the equipment-- or the importer/exporter) pay for the collection, treatment, recovery, and disposal of their equipment (Article 5). For sales to businesses, this cost may be shared between the seller and buyer (Article 9, as amended by Directive 2003/108/EC). The actual processing may be done by the company itself, or by participating in a producers' compliance scheme (Article 6.1).
- The producer must provide financial guarantees that they will pay for the handling of their waste equipment, by participating in a collective group for this financing, recycling insurance, or a blocked bank account (Article 8.2).
- Requires the producer to mark their electrical/ electronic equipment (or the packaging, instructions, and warranty) with the WEEE Symbol below (Annex IV) after **August 13, 2005** (Article 10, paragraph 3).

# RoHS Directive

- Most solder materials in lead free components are many times more toxic than the current SnPb compound
- Soldering and finishing process uses so little lead compared to the rest of the industry ( < 0.5%)
  - Elimination of lead will have no significant environmental impact

# ROHS Reliability Impact

- RoHS Directive 2002/95/EC
  - WEEE Directive 2002/96/EC
- Failure Mechanisms
  - Tin Whiskers
    - Mechanisms
  - Solder Joint Failures
  - Mitigation Strategies
- Tensile Strength
- Solderability
  - Testing
  - Shelf Life
  - Plating Considerations

# ROHS Reliability Impact

  - WEEE Directive 2002/96/EC
- Failure Mechanisms
  - **Tin Whiskers**
    - Mechanisms
  - Solder Joint Failures
  - Mitigation Strategies
- Tensile Strength
- Solderability
  - Testing
  - Shelf Life
  - Plating Considerations

# Tin Whiskers

- What is a Whisker?
  - Whiskers are elongated single crystals of pure tin. 1 to 5 microns in diameter, 0.5 to 5.0 mm (.0197 to .197 inches)
    - Grow spontaneously without an applied electric field or moisture
      - Independent of atmospheric pressure
        - Can grow in a vacuum
  - Whiskers Appearance
    - Straight, kinked, hooked, forked and hollow
      - Outer surfaces are striated

# ROHS Reliability Impact

- RoHS Directive 2002/95/EC
  - WEEE Directive 2002/96/EC
- Failure Mechanisms
  - Tin Whiskers
    - Mechanisms
  - Solder Joint Failures
  - Mitigation Strategies
- Tensile Strength
- Solderability
  - Testing
  - Shelf Life
  - Plating Considerations

# Tin Whisker Mechanisms

- Residual Stresses with the tin plating
  - **Contaminates**
    - Organic brighteners
    - copper
  - **Grain Size**
    - Small grain size (bright acid tin) 0.5 to .8  $\mu\text{m}$  (19.7 to 31.5) micro-inches diameter, 0.2 to 1.0 % carbon content
      - Shiny appearance will exhibit high probability to promote whisker growth
    - Large grain size (Matte tin) 1 to 5  $\mu\text{m}$  (39.3 to 197) micro-inches diameter, 0.005 to 0.050 % carbon content
      - Dull appearance will exhibit low probability to promote whisker growth
  - **Current density**
    - Electro-deposited finishes are considered at greater risk because higher current densities produced higher residual stresses and more whiskers

# Tin Whisker Mechanisms

- **Damage to Tin Coating Surfaces**
  - Bending, stretching, scratching or nicking of the plating creates localized stresses which serve as the nucleation point for whiskers
    - Handling damage
- **Mechanical Loading to Tin Coating Surfaces**
  - Turning of nuts or screws or spring loaded fixtures

# Tin Whisker Mechanisms

- Formation of Intermetallic compounds

- $(\text{Cu}_6\text{Sn}_5)$ ,  $(\text{Ni}_3\text{Sn}_4)$  Eta and  $(\text{Cu}_3\text{Sn})$ ,  $(\text{NiSn}_3)$  Epsilon phases between the Tin grain boundaries
- Lack of barrier coating between substrate (i.e. Brass) and Tin Coating
  - Copper Ion Migration
- Using Copper barrier coating between substrate (i.e. Brass) and Tin Coating
  - Copper Ion Migration
- Using Nickel barrier coating between substrate (i.e. Brass) and Tin Coating
  - Nickel Ion Migration

  - Shelf Life
  - Plating Considerations

# Solder Joint Failures

4

## Stage 1 - Preheat Zone (Rapid Heating Stage)

The purpose of this zone is to quickly bring the assembly up to a temperature where solder paste can become chemically active.

## Stage 2 - Soak Zone (Temperature Equalization Zone)

The purpose of this stage is for the thermal mass of the assembly to reach a uniform temperature plateau so that there is a very small differential between the hottest and coldest soldering locations on the assembly.

## Stage 3 - Reflow Zone (Rapid Heating and Cooling)

The purpose of this stage is to rapidly heat the assembly above the melting (liquidus) temperature of the solder and subsequently cool the assembly down quickly to solidify the solder. Wetting of solder onto substrates occurs in the reflow zone.

**Lead-Free Reflow Profile**  
Alloys: Sn96.5Ag3.0Cu0.5 and Sn96.5Ag3.5

# Solder Joint Failures

- Elevated reflow temperatures threaten plated through hole reliability and increase the potential for delamination of a PWB
  - 230°C (446°F) versus 260°C (500°F)
- Glass Transition Temperature (Tg) – PWB
  - Tg of a resin system is the temperature as which the material transitions from a rigid to a softened state

# Solder Joint Failures

- -Tg is the material property typically used by Industry for comparing thermal robustness
- Coefficient of Thermal Expansion (CTE)
  - - CTE is the measure of a material's expansion both below and above the Tg expressed in PPM

# Solder Joint Failures

- - Below  $T_g$ , a PWB material will expand according to its CTE
- - At the  $T_g$ , a PWB material will exhibit a dramatic increase in its CTE
  - Low CTE values for a material at or above its  $T_g$  increases the reliability for PTHs
- Decomposition Temperature –  $T_d$ 
  - This value is determined by the measurement of the weight loss of a material versus temperature
    - IPC 5 % loss level

# Solder Joint Failures

- Td is a very critical material property for assessment of a material's thermal survivability
  - TMA – Thermo-Gravimetric Analysis
  - DSC – Differential Scanning Calorimetry

- FR4

- Td 270°C

Phenolic FR4

Td 345 - 365°C

# Solder Joint Failures

- 63 / 37 SnPb Melt Temperature
  - 361°F (183°C)
- 100 % Sn
  - 450°F (232°C)
- 96.3Sn(3.4 – 4.1)Ag(.45-.90)Cu (SAC)
  - 423°F (217°C)

89°F(49°C ) Differential

62°F(34°C ) Differential

# Solder Joint Failures

- 96.3Sn(3.4 – 4.1)Ag(.45-.90)Cu (SAC) MP 423°F (217°C)
  - 30°C higher surface mount reflow temp
  - Slower wetting time
  - Double the cost for the raw material
  - Environmental concerns with Ag
  - Stronger and stiffer than SnPb but lower ductility

# Solder Joint Failures

- 96.3Sn(3.4 – 4.1)Ag(.45-.90)Cu (SAC) MP 423°F (217°C)
  - Large thermal mass of PWB
    - Large component- coldest spot 30°C (54°F)
    - Small component – highest spot
  - Reflow Soldering temperatures must reach  $\geq 260^{\circ}\text{C}$  ( 500°F)
    - Aluminum electrolytic capacitors suffer dielectric cracking at temp  $\geq 245^{\circ}\text{C}$  (473°F)
    - Large plastic grid arrays are prone to warping at  $\geq 260^{\circ}\text{C}$  ( 500°F)
    - Thermal expansion of PWB substrate resulting in weakened or cracked PTHs

# Solder Joint Failures

- Lead Free Soldering will increase the following defects
  - Non-Wetting
  - Insufficient Solder
  - De-Wetting
  - Icicle Formation
  - Colder Solder Joints
  - Grainy Solder
  - Blow Holes
  - Solder Balls
  - Fillet Lifting
  - PTH Cracking

# Solder Joint Failures

Solder pot temperature will play a role in hole-fill as temperature is increased. The photos to the right, indicate the degree of hole-fill as solder temperature increases from 240, 250 to 260°C using SAC solder.

# Solder Joint Failures

## ACCEPTABLE MINIMUM

1. Solder shows graininess and surface flow lines with a dull metallic appearance.
2. Line of demarcation between solder fillet and land is abrupt; however solder flow is unbroken and entire solder connection is wetted.

## REJECT

1. Solder has failed to flow and wet land.
2. Stress cracks in solder at edge of fillet.

4-56

# Solder Joint Failures

# Solder Joint Failures

Figure 1. An example of PTH barrel cracking.

# Solder Joint Failures

# ROHS Reliability Impact

- RoHS Directive 2002/95/EC
  - WEEE Directive 2002/96/EC
- Failure Mechanisms
  - Tin Whiskers
  - Solder Joint Failures
    - Mechanisms
  - Mitigation Strategies
- Tensile Strength
- Solderability
  - Testing
  - Shelf Life
  - Plating Considerations

# Tin Whisker Mitigation Strategies

- Conformal Coat applied over top of a whisker-prone surface will **NOT** prevent the formation of tin whiskers
- Whisker growths INITIATE faster on specimens that are covered with conformal coating
  - Conformal coating also reduces but does not eliminate) the rate of growth of tin whiskers compared to an uncoated specimen.
- Annealing Tin coating @ 302° F (150° C)
  - Initial testing appears to be promising

# ROHS Reliability Impact

- RoHS Directive 2002/95/EC
  - WEEE Directive 2002/96/EC
- Failure Mechanisms
  - Tin Whiskers
    - Mechanisms
  - Solder Joint Failures
  - Mitigation Strategies
- **Tensile Strength**
- Solderability
  - Testing
  - Shelf Life
  - Plating Considerations

# Tensile Strength

The tensile strength of solder increases depending on tin content. At room temperature the tensile strength reaches its peak at 65% (7,900 psi).

*("Solders and Soldering", H. Manka, Mc Graw-Hill Book Co., 1979)*

# Electrical Conductivity

There is a straightforward linear correlation between the tin content and the electrical conductivity of the alloy. the higher the tin content in the alloy, the better the electrical conductivity.

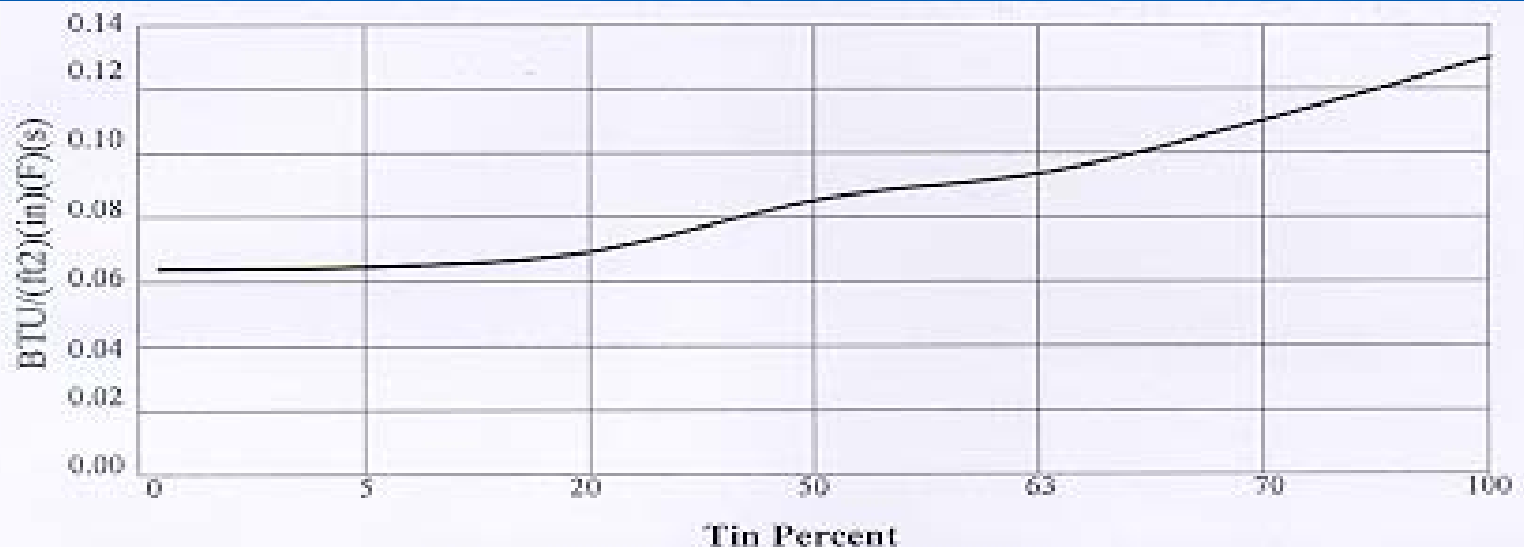

Higher tin-content increases conductivity (%IACS: Percentage in reference to conductivity of Cu.)

*("Solders and Soldering", H. Manka, Mc Graw-Hill Book Co., 1979)*

# Thermal Conductivity

The thermal conductivity diagram shows the linear relationship between the tin content and the thermal conduction capabilities of the solder alloy. the capability of the alloy to effectively conduct heat to the PC boards becomes an important parameter in residue-free soldering because of the improved capability of the solder to eliminate excess flux.

Higher tin-content increases thermal conductivity.  
*("Solders and Soldering", H. Manko, Mc Graw-Hill Book Co., 1979)*

# ROHS Reliability Impact

- RoHS Directive 2002/95/EC
  - WEEE Directive 2002/96/EC
- Failure Mechanisms
  - Tin Whiskers
  - Solder Joint Failures
  - Mitigation Strategies
- Tensile Strength
- **Solderability**
  - Testing
  - Shelf Life
  - Plating Considerations

# Solderability Testing

- Formation of Intermetallic compounds
- Copper
  - ( $\text{Cu}_6\text{Sn}_5$ ) Eta and ( $\text{Cu}_3\text{Sn}$ ) Epsilon phases between the Tin grain boundaries
- Nickel
  - ( $\text{Ni}_3\text{Sn}_4$ ) Eta and ( $\text{NiSn}_3$ ) Epsilon phases between the Tin grain boundaries
  - Eta Phase promotes solderability with a lower activation energy
  - Epsilon Phase does **Not** promote solderability because of a high activation energy

# ROHS Reliability Impact

- RoHS Directive 2002/95/EC
  - WEEE Directive 2002/96/EC
- Failure Mechanisms
  - Tin Whiskers
    - Mechanisms
  - Solder Joint Failures
  - Mitigation Strategies
- Tensile Strength
- Solderability
  - Testing
  - Shelf Life
  - Plating Considerations

# Solderability Testing

- IPC/EIA/JEDEC J-STD-002B
  - Coating Durability 3
    - Intended for Sn and SnPb coatings
    - Steam aging
      - 8 hours +/- 15 mins
    - Flux
      - 25% solids white water non activated Rosin
        - Kester 145
    - Solder Bath Temperature
      - 473 +/- 9° F (245 +/- 5° C)

# Solderability Plating Considerations

## ■ Solderability

- Copper migration from base material requires a barrier plating
  - Copper 100 microinches
  - Nickel 50 microinches

# ROHS Reliability Impact

- RoHS Directive 2002/95/EC
  - WEEE Directive 2002/96/EC
- Failure Mechanisms
  - Tin Whiskers
    - Mechanisms
  - Solder Joint Failures
  - Mitigation Strategies
- Tensile Strength
- Solderability
  - Testing
  - Shelf Life
  - Plating Considerations

# Solderability Shelf Life Considerations

## ■ Shelf Life

- Shelf life is dependent upon barrier and top coating thicknesses along with any thermal excursions that component experiences
- **Shelf life begins at the moment of plating!!!!**
  - 24°C
    - 100 % Sn
      - 100 % acceptability – 6 months
      - 57 % acceptability – 12 months
      - 43 % acceptability – 18 months
    - 90/10 SnPb – 100 % acceptability for 6 months and 86 % acceptability out to 24 months
    - 60/40 SnPb – 100 % acceptability out to 24 months

# ROHS Reliability Impact

- RoHS Directive 2002/95/EC
  - WEEE Directive 2002/96/EC
- Failure Mechanisms
  - Tin Whiskers
    - Mechanisms
  - Solder Joint Failures
  - Mitigation Strategies
- Tensile Strength
- Solderability
  - Testing
  - Shelf Life
  - **Plating Considerations**

# Plating Considerations

## ■ Barrier Plating

- Nickel per SAE AMS-QQ-N-290
  - 2.03um (80 microinches) minimum
    - Verify via Microsectioning per ASTM B487

## ■ Top Coating

- Tin Plating per ASTM B545
  - (5.08 – 7.62 um) 200 – 300 microinches
    - Verify via Microsectioning per ASTM B487

# Plating Considerations

- Nickel barrier are not new to the electronics industry.
- They are used on surface-mount components to improve wetting, reduce solder leaching, and reduce tombstoning
- They have been used to prevent solder from leaching into parts like precision resistors so that their properties would not change over time
- They have also been used to keep copper from diffusing out into gold top coating

# Plating Considerations

- Nickel Sulfamate
  - Low stress deposit
  - Hull Cell Analysis
    - Contaminates
      - Lead
      - Chromium
      - Zinc
    - Carbon Treatment

# Plating Considerations

## ■ Tin

- Hull Cell Analysis

- Contaminates

- Lead
    - Chromium
    - Zinc

- Carbon Treatment

- Copper contamination critical to Tin Whiskering

# Plating Considerations

## ■ Barrier Plating

- Nickel per SAE AMS-QQ-N-290
  - 2.03um (80 microinches) minimum
    - Verify via Microsectioning per ASTM B487

## ■ Top Coating

- Palladium Plating per ASTM B679
  - 1.27 um(50 microinches) minimum
    - Verify via Microsectioning per ASTM B487

# Plating Considerations

## ■ Barrier Plating

- Nickel per SAE AMS-QQ-N-290
  - 2.03um (80 microinches) minimum
    - Verify via Microsectioning per ASTM B487

## ■ Top Coating

- Gold Plating per ASTM B488
  - 1.27-2.54um(50-100 microinches) minimum
    - Verify via Microsectioning per ASTM B487

# Whisker Testing

- JEDEC Standard JESD22A121
  - Test Method for Measuring Whisker Growth on Tin and Tin Alloy Surface finishes
    - Ambient Storage (30°C, 60% R/H) 3000 cycles
    - Temperature Cycling (-55 to +85°C) 3000 cycles
    - Temperature Humidity Storage (60°C, 93% R/H) 3000 cycles

# Whisker Testing

## ■ JEDEC Class Criteria

### 18.3.1. Class 1

Mission/Life Critical High-Reliability Applications — military, space and medical applications. Pure tin and high tin content alloys not acceptable.

### 18.3.2. Class 2

High-Reliability Business Applications — telecom infrastructure equipment, high-end servers, etc. which require long product lifetimes and minimal downtime. Products such as disc drives typically fall into this category. Breaking off of a tin whisker is a concern.

### 18.3.3. Class 3

Consumer Products — with relatively short product lifetimes (typically five years maximum). No major concerns by the user that the tin whiskers might break off and cause problems elsewhere in the product.

# Whisker Testing

## ■ JEDEC Acceptance Criteria

| Maximum Whisker Length  |  |                  |   |
|---|--|------------------|---|
| Device Considerations<br>(Package type, lead pitch or operating frequency)              | Class 1  | Class 2          | Class 3   |
| Discrete Device<br>(2 pins)   | Pure tin and high tin content alloys not acceptable. | 40 $\mu\text{m}$ | 67 $\mu\text{m}$ <sup>(1)</sup>   |
| Multi-lead packages   |  |                  | (Minimum gap between leads - .05mm)/3 or 67 $\mu\text{m}$ , whichever is smaller <sup>(1)(2)(3)</sup> |
| Operating Frequency > 6GHz (RF) <sup>(4)</sup> or $t_{\text{rise}} < 59$ psec (digital) |  |                  | 50 $\mu\text{m}$  |
